Note A general arrangement plan of the complete ship showing the main vertical fire zones, spaces along the ship bottom that are not fitted with a double bottom and the location of equipment and cable routes, including identification of relevant high fire risk areas, for the above systems, is to be made available for the use of the Surveyor on board.

1.2.13 Evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas, as required by *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.8* and *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.9*, including a schedule of electrical and electronic equipment located in protected areas and adjacent areas, and general arrangement plans showing the coverage of the protected areas and adjacent areas. See also *Pt 6, Ch 2, 1.11 Location and construction*.

1.2.14 For battery installations, arrangement plans and calculations are to show compliance with *Pt 6, Ch 2, 12.5 Thermal management and ventilation*.

1.2.15 A schedule of batteries fitted for use for emergency and essential services, giving details of:

- type and manufacturer's type designation;
- voltage and ampere-hour rating;
- location;
- equipment and/or system(s) served;
- maintenance/replacement cycle dates;
- date(s) of maintenance and/or replacement; and
- for replacement batteries in storage, the date of manufacture and shelf life; with accompanying battery replacement procedure documentation to show compliance with *Pt 6, Ch 2, 12.7 Recording of batteries for emergency and essential services*.

Note The above includes all batteries fitted as part of an uninterruptible power system (UPS) used for any essential or emergency services.

1.2.16 For high voltage rotating machines, type test reports for stator insulation systems, see *Pt 6, Ch 2, 9.1 General requirements 9.1.15*.

1.2.17 **Lithium battery systems.** In addition to the plans and information required by *Pt 6, Ch 1, 1.2 Documentation required for design review 1.2.2*, the following information is also to be submitted:

- (a) System functional description including all operating modes (i.e. charging, discharging, standby, backup, peak shaving, etc.), safety functions and their hierarchy, and expected battery system behaviour in case of malfunction.
- (b) Technical description detailing how safety information from type testing has been considered in the actual installation design.
- (c) Integration plan for the battery system with the vessel power distribution and charging arrangements.
- (d) Line diagrams of the battery system control and power distribution, including switchgear, protective devices, controlgear and emergency trip (E-Trip) as well as interfaces to external systems.
- (e) A Failure Mode and Effects Analysis (FMEA) and mitigation strategy, which is to be carried out for the lithium battery system installation as a whole in accordance with IEC 60812: *Analysis techniques for system reliability – Procedure for failure mode*

and effects analysis (FMEA), or an equivalent and acceptable National or International Standard and the report and worksheets are to be submitted for consideration.

- (f) Arrangement plans of any HVAC, ventilation, cooling system and drains for the battery space.
- (g) Fire detection, alarm and extinguishing system (including portable fire-fighting appliances) plans for the battery space.
- (h) A schedule of electrical equipment for use in the battery space and HVAC, ventilation and cooling system giving details of the appropriate type of protection for the temperature class and gas group of the potential gases. Copies of appropriate certification are to be submitted for consideration.
- (i) Arrangement plans for electrical equipment showing cable routes associated with the battery system, power distribution and E-Trip.
- (j) General arrangement plan showing hazardous zones for the battery space, including the HVAC, ventilation, cooling system and drains.
- (k) Fire integrity plans for the battery space (including penetrations drawings), contiguous spaces and means of escape from the battery space.

1.2.18 For ships with hybrid electrical power systems as detailed in *Pt 6, Ch 2, 24 Hybrid electrical power systems* the following documentation is to be submitted for design review either uniquely or integrated with other submitted information.

Information required for all hybrid electrical power systems:

- (a) A functional description of the electrical distribution systems and equipment that details compliance with the performance criteria and system capability and functionality under defined normal and reasonably foreseeable abnormal conditions including:
 - (i) degraded modes of operation;
 - (ii) load management and load sharing philosophy;
 - (iii) earthing philosophy;
 - (iv) system electrical protection philosophy;
 - (v) system stability; and
 - (vi) converter switching actions.
- (b) Definition of system performance targets (see *Pt 6, Ch 2, 24.5 Hybrid electrical power system performance - System performance targets*);
- (c) Definition of dependability principles (see *Pt 6, Ch 2, 24.6 Hybrid electrical power system performance - Dependability principles*);
- (d) Calculations supporting the size and rating of stores of electrical energy (see *Pt 6, Ch 2, 24.6 Hybrid electrical power system performance - Dependability principles 24.6.7*);
- (e) Risk assessment in support of there being no dedicated emergency source of power when this is proposed (see *Pt 6, Ch 2, 24.8 Hybrid electrical power system performance - Emergency source of electrical power 24.8.2*);
- (f) Details of any arrangements for external sources of power to charge onboard stores of electrical energy (see *Pt 6, Ch 2, 24.9 Hybrid electrical power system performance - External source of electrical power 24.9.4*);
- (g) Voltage rate of rise times for pulse width modulated converters (see *Pt 6, Ch 2, 24.11 Hybrid electrical power system components - Source of electrical power 24.11.6*);
- (h) Risk assessment in support of active fault current limiting devices when this is proposed (see *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.11*);
- (i) Technical description of energy management functionality (see *Pt 6, Ch 2, 24.16 Hybrid electrical power system components - Energy management 24.16.8*);
- (j) Technical description of arrangements for power quality monitoring (see *Pt 6, Ch 2, 24.17 Transversal requirements 24.17.6*);
- (k) Power system integration procedure (see *Pt 6, Ch 2, 24.18 Power system development and integration - General*);
- (l) System operational concept (see *Pt 6, Ch 2, 24.19 Power system development and integration - System operational concept*);
- (m) Technical description of operating modes (see *Pt 6, Ch 2, 24.20 Power system development and integration - Operating modes*);
- (n) Validated specifications of system components (see *Pt 6, Ch 2, 24.22 Power system development and integration - System components*);
- (o) Results of energy flow analysis (see *Pt 6, Ch 2, 24.23 Power system development and integration - Energy flows*);
- (p) Results of power system analysis (see *Pt 6, Ch 2, 24.24 Power system development and integration - Power system analysis*);

- (q) Definition of safety functions (see *Pt 6, Ch 2, 24.25 Power system development and integration - Safety functions*);
- (r) System FMEA (see *Pt 6, Ch 2, 24.27 Power system development and integration - System Failure Modes and Effects Analysis (FMEA)*);
- (s) System operating instructions (see *Pt 6, Ch 2, 24.28 Power system development and integration - Operating instructions*);
- (t) Description and verification of ship-specific Operator training needs (see *Pt 6, Ch 2, 24.29 Power system development and integration - Operator training*); and
- (u) Description of through-life system integration roles and responsibilities (see *Pt 6, Ch 2, 24.30 Power system development and integration - Through-life accountability*).

Additional information required for Hybrid Power (+) notation systems:

- (a) Dependability assessment (see *Pt 6, Ch 2, 24.6 Hybrid electrical power system performance - Dependability principles*);
- (b) Technical description of arrangements for automatic earth fault location (see *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.14*);
- (c) Technical description of arrangements for power quality degradation detection (see *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.23*);
- (d) Technical description of additional energy management functionality (see *Pt 6, Ch 2, 24.16 Hybrid electrical power system components - Energy management 24.16.8*);
- (e) Validation, verification and results of energy flow simulation (see *Pt 6, Ch 2, 24.23 Power system development and integration - Energy flows 24.23.3*);
- (f) Validation, verification and results of power system simulation (see *Pt 6, Ch 2, 24.24 Power system development and integration - Power system analysis 24.24.4*);
- (g) Risk assessment study when required (see *Pt 6, Ch 2, 24.26 Power system development and integration - Risk assessment*); and
- (h) Evidence of ship-specific Operator training verification (see *Pt 6, Ch 2, 24.29 Power system development and integration - Operator training 24.29.2*).

1.3 Documentation required for supporting evidence

1.3.1 The documentation and particulars in *Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.2* to *Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.11.(b).(iii)* are to be submitted as supporting evidence.

1.3.2 Plans for all cables that pass through atria or equivalent spaces, and for vertical runs in trunks or other restricted spaces. The information supplied is to show compliance with *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables 11.8.13*.

1.3.3 In order to establish compliance with *Pt 6, Ch 2, 1.11 Location and construction 1.11.4* and *Pt 6, Ch 2, 5.1 Systems of supply and distribution 5.1.4*, a general arrangement plan of the ship showing the location of major items of electrical equipment, for example:

- main and emergency generators;
- transitional source of supply (where fitted);
- switchboards;
- section boards and distribution boards supplying essential and emergency services;
- emergency batteries;
- motors for emergency services;
- propulsion motors;
- propulsion transformers;
- propulsion semiconductor converters;
- dynamic braking equipment;
- reactors;
- harmonic filters; and
- cable routes between these items of equipment.

1.3.4 Arrangement plans of main and emergency switchboards, section boards and documentation that demonstrates that creepage and clearance distances are in accordance with *Pt 6, Ch 2, 7.5 Creepage and clearance distances*. The form factor of internal separation of low voltage switchgear and controlgear assemblies is to be in accordance with IEC 61439-2: *Low-voltage switchgear and controlgear assemblies — Part 2: Power switchgear and controlgear assemblies*, or an alternative acceptable and

relevant national Standard. The form factor is to be stated, and the arrangement plans are to show how the form factor has been achieved.

1.3.5 Schedule of normal and emergency operating loads on the system estimated for the different operating conditions expected. The following details are to be provided to meet this requirement:

- (a) a description of the expected operating profiles (e.g. the number of generating sets connected when manoeuvring at sea, etc.), including that required by Part 5 *Table 2.1.1 Plans and particulars to be submitted*; and
- (b) a schedule of the normal and emergency operating loads, which is to state the kilowatt rating of each load and a load factor between 0 and 1 that reflects:
 - (i) the duty cycle of the load; and
 - (ii) the proportion of its maximum rating at which the load is expected to operate.

1.3.6 In order to establish compliance with the requirements of *Pt 6, Ch 2, 1.7 Design and construction 1.7.3*, when requested, evidence is to be submitted to demonstrate the suitability of electrical equipment for its intended purpose in the conditions in which it is expected to operate.

1.3.7 For non-metallic cable support systems or protective casings, test evidence, details of installation procedures and manufacturer's recommendations that show compliance with *Pt 6, Ch 2, 11.13 Non-metallic cable support systems, protective casings and fixings*.

1.3.8 Details of, and arrangements in, the spaces in which the lighting is required to satisfy the requirements of *Pt 6, Ch 2, 23 Ergonomic Lighting Design – ELD optional notation* Ergonomic Lighting Design (ELD) optional notation.

1.3.9 Evidence demonstrating the compatibility of the converter, cable and motor combinations to be used for the provision of essential services. Particular attention is to be given the suitability of the insulation systems used with respect to the converter impulse magnitudes and voltage rise times, and their implications for partial discharge.

1.3.10 For high voltage a.c. rotating machines rated at above 3,6 kV, an inspection and test plan is required which enables the requirements of *Pt 6, Ch 2, 9.8 Survey and testing 9.8.7* to be assessed.

1.3.11 **Lithium battery systems.** In addition to the plans and information required by *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.17*, the following information is also to be submitted:

- (a) Document outlining the operational limitations for the battery system.
- (b) Operation, maintenance and training manuals for the battery system are to be kept on board including:
 - (i) Manual that describes the standard operating, maintenance and emergency procedures for the system;
 - (ii) Testing procedures including Annual Survey test requirements (see *Table 2.21.3 Test requirements on lithium battery systems*);
 - (iii) Through-life management plan for the battery system, including disposal.

1.4 Surveys

1.4.1 Electrical propelling machinery and associated equipment together with auxiliary services essential for the safety of the ship are to be installed in accordance with the relevant requirements of this Chapter, surveyed and have tests witnessed by the Surveyors.

1.4.2 The following equipment, where intended for use for essential and emergency services, is to be surveyed by the Surveyors during manufacture and testing:

- Converting equipment of 100 kW and over;
- Rotating machines of 100 kW and over;
- Switchboards and section boards; and
- UPS units of 50 kVA and over.

1.4.3 For electric propulsion systems, in addition to the equipment listed in *Pt 6, Ch 2, 1.4 Surveys 1.4.2*, the following equipment is to be surveyed by the Surveyors during manufacture and testing:

- dynamic braking assemblies, see *Pt 6, Ch 2, 16.6 Protection of propulsion system 16.6.8*;
- exciters;
- filters;
- reactors;

- pre-magnetisation transformers; and
- slip ring assemblies.

1.4.4 For refrigerating cargo installations having an **RMC** notation, motors are to be tested and certificates furnished by the manufacturer. Motors of 100 kW or over are to be surveyed by the Surveyors during manufacture and testing.

1.4.5 All other electrical equipment, not specifically referenced in *Pt 6, Ch 2, 1.4 Surveys 1.4.2* to *Pt 6, Ch 2, 1.4 Surveys 1.4.4*, intended for use for essential or emergency services is to be supplied with a manufacturer's works test certificate showing compliance with the constructional Standard(s) as referenced by the relevant requirements of this Chapter.

1.4.6 Alternative approach for product assurance;

- LR will be prepared to give consideration to the adoption of an approach for product assurance, utilising regular and systematic audits of an organisation's arrangements for assuring product quality, as an alternative to the direct survey of individual items.
- Alternative approaches for product assurance are to be approved by LR. In order to obtain approval, the requirements of *Pt 5, Ch 1, 6 Quality Assurance Scheme for Machinery* or *Ch 1, 2.4 Materials Quality Scheme* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021* are to be complied with. Proposals for equivalent approaches are to be submitted for consideration.

1.5 Additions or alterations

1.5.1 No addition, temporary or permanent, is to be made to the approved load of an existing installation until it has been ascertained that the current carrying capacity and the condition of the existing equipment including cables and switchgear are adequate for the increased load.

1.5.2 Plans are to be submitted for consideration, and the alterations or additions are to be carried out under the survey, and to the satisfaction of the Surveyors.

1.5.3 When it is proposed to replace permanently installed secondary valve-regulated sealed batteries with vented batteries, details are to be submitted for consideration to ensure continued safety in the presence of the products of electrolysis and evaporation being allowed to escape freely from the cells to the atmosphere. These details are to demonstrate that there will be adequate ventilation in accordance with *Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.9* and that the location and installation requirements of *Pt 6, Ch 2, 12.3 Location* and *Pt 6, Ch 2, 12.4 Installation* are complied with.

1.5.4 Proposed modifications to the electrical protection settings are to be developed in accordance with *Pt 6, Ch 2, 6.1 General 6.1.4* and plans submitted are also to address the updating of approved version of the details required by *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.5* and *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.6*.

1.5.5 Where it is intended to replace an existing incandescent lamp type navigation light with a light emitting diode type navigation light, details are to be submitted for consideration that demonstrate compliance with *Pt 6, Ch 2, 15.6 Navigation lights*. Light emitting diode type navigation lights failure detection arrangements are to satisfy the requirements of *Pt 6, Ch 2, 15.6 Navigation lights 15.6.5* and *Pt 6, Ch 2, 15.6 Navigation lights 15.6.6*.

1.6 Definitions

1.6.1 Essential services are those necessary for the propulsion and safety of the ship, such as the following:

- air compressors for oil engines;
- air pumps;
- automatic sprinkler systems;
- ballast pumps;
- bilge pumps;
- circulating and cooling water pumps;
- communication systems;
- condenser circulating pumps;
- electric propulsion equipment;
- electric starting systems for engines;
- extraction pumps;
- fans for forced draught to boilers;
- feed water pumps;

-
- fire detection and alarm systems;
 - fuel valve cooling pumps;
 - hydraulic pumps for controllable pitch propellers and those serving essential services here listed that would otherwise be directly electrically driven;
 - lubricating oil pumps;
 - inert gas fans and scrubber and deck seal pumps;
 - lighting systems for those parts of the ship normally accessible to and used by personnel and passengers;
 - liquefied gas cargo handling;
 - navigational aids where required by Statutory Regulations;
 - navigation lights and special purpose lights where required by Statutory Regulations;
 - fuel oil pumps and fuel oil burning units;
 - oil separators;
 - pumps for fire-extinguishing systems;
 - scavenge blowers;
 - steering gear;
 - thrusters needed for the propulsion and safety of the ship to be considered as essential services;
 - valves which are required to be remotely operated;
 - ventilating fans for engine and boiler rooms;
 - watertight doors, shell doors and other electrical operated closing appliances;
 - windlasses;
 - power sources and supply systems for supplying the above services; and
 - steam raising plant, where steam is required for other essential services.

1.6.2 Services such as the following are considered necessary for minimum comfortable conditions of habitability:

- cooking;
- heating;
- domestic refrigeration;
- mechanical ventilation;
- sanitary and fresh water.

1.6.3 Services such as the following, which are additional to those in *Pt 6, Ch 2, 1.6 Definitions 1.6.1* and *Pt 6, Ch 2, 1.6 Definitions 1.6.2*, are considered necessary to maintain the ship in a normal sea-going operational and habitable condition:

- cargo handling and cargo care equipment;
- hotel services, other than those required for habitable conditions;
- thrusters, other than those for dynamic positioning.

1.6.4 A 'high voltage' is a voltage exceeding 1000 V a.c. or 1500 V d.c. between conductors, *see also Pt 6, Ch 2, 1.5 Additions or alterations 1.5.3*.

1.6.5 A 'switchboard' is a switchgear and controlgear assembly for the control of power generated by a source of electrical power and its distribution to electrical consumers.

1.6.6 A 'section board' is a switchgear and controlgear assembly for controlling the supply of electrical power from a switchboard and distributing it to other section boards, distribution boards or final sub-circuits.

1.6.7 A 'distribution board' is an assembly of one or more protective devices arranged for the distribution of electrical power to final sub-circuits.

1.6.8 A 'final sub-circuit' is that portion of a wiring system extending beyond the final overcurrent device of a board.

1.6.9 'Special category spaces' are those enclosed spaces above or below the bulkhead deck intended for the carriage of motor vehicles with fuel, for their own propulsion, in their tanks, into and from which such vehicles can be driven, and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m.

1.6.10 'Machinery spaces of Category A' are those spaces and trunks to such spaces which contain:

- (a) internal combustion machinery used for main propulsion; or

- (b) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
- (c) any oil-fired boiler or fuel oil unit.

1.6.11 'Dead ship condition' means that the entire machinery installation, including the power supply, is out of operation and that the auxiliary services for bringing the main propulsion systems into operation (e.g. compressed air, starting current from batteries, etc.) and for the restoration of the main power supply are not available. Means are to be available to start the emergency generator at all times, see *Pt 5, Ch 2, 9.5 Starting of the emergency source of power*.

1.6.12 Protected space is a machinery space where a fixed water-based local application fire-fighting system is installed.

1.6.13 Protected areas are areas within a protected space which are protected by a fixed water-based local application fire-fighting system.

1.6.14 Adjacent areas are areas, other than protected areas, exposed to direct spray or other areas where water may extend when a fixed water-based local application firefighting system is activated.

1.6.15 For emergency services and their emergency power supplies required to be capable of being operated under fire conditions, 'high fire risk areas' are:

- (a) machinery spaces, except auxiliary machinery spaces having little or no fire risk, as defined by SOLAS 1974 as amended, *Chapter II-2 - Construction - Fire protection, fire detection and fire extinction*;
- (b) spaces containing fuel treatment equipment;
- (c) galleys and pantries containing cooking appliances;
- (d) laundries containing drying equipment;
- (e) spaces containing flammable substances; and
- (f) for passenger ships carrying more than 36 passengers:
 - (i) public spaces containing furniture and furnishings of other than restricted fire risk and having a deck area of 50 m² or more;
 - (ii) barber shops and beauty parlours; and
 - (iii) saunas.

Requests to exempt spaces identified in *Pt 6, Ch 2, 1.6 Definitions 1.6.15(f)* may be considered when evidence is submitted that demonstrates emergency services will remain available in the event of a fire in the space (e.g. studies of fire protection measures, installation locations, system redundancy, etc.).

1.6.16 An 'electric arc' is an electrical discharge or a short-circuit through ionised air caused by isolation or insulation integrity failure.

1.6.17 'Incident energy' is the amount of energy impressed on a surface, a certain distance from the source, generated during an electric arc event.

1.6.18 A 'secondary lithium cell' is a cell where electrical energy is derived from the insertion/extraction reactions of lithium ions or oxidation/reduction of lithium between the negative electrode and the positive electrode. These may be combined in 'cell blocks' consisting of a group of cells connected together in a parallel configuration.

1.6.19 A 'battery module' is an energy storage device comprising one or more electrically connected cells or cell blocks. The battery module can include protective and monitoring devices.

1.6.20 A 'battery pack' is an energy storage device comprising one or more electrically connected cells, cell blocks or modules. The battery pack can include protective devices and control and monitoring systems which communicate with the battery management system.

1.6.21 A 'battery management system (BMS)' is an electronic system which monitors and manages the state of a cell, battery module or battery pack in order to maintain the battery system in a safe operating state and protect against overcharging, overcurrent and overheating and communicates with an external charge/discharger controller.

1.6.22 A 'lithium battery system' is a system comprising one or more lithium battery modules or packs incorporated in a fixed installation together with means of isolation, a cooling system (if provided) and has an associated BMS.

1.6.23 'State of charge (SOC)' is the available capacity in a battery expressed as a percentage of rated capacity.

1.6.24 'State of health (SOH)' reflects the general condition of a battery expressed as a percentage of its ability to deliver the specified performance compared with that of a new battery.

1.6.25 'Battery space' is the space or compartment in which a battery is installed.

1.7 Design and construction

1.7.1 Electrical propelling machinery and associated equipment together with equipment for services essential for the propulsion and safety of the ship are to be constructed in accordance with the relevant requirements of this Chapter.

1.7.2 The design and installation of other equipment is to be such that risk of fire due to its failure is minimised. It is, as a minimum, to comply with a National or International Standard revised where necessary for ambient conditions.

1.7.3 Electrical equipment is to be suitable for its intended purpose and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the Procedure for LR Type Approval System will be supplied on application.

1.7.4 Permanently installed electrical and electronic equipment that are capable of generating electromagnetic interference, which can interfere with the proper functionality of essential services or services upon which they depend, are to be designed, constructed and installed in accordance with the guidelines and recommendations of one of the following standard(s), as appropriate to its location:

- (a) IEC 60533 - *Electrical and electronic installations in ships - Electromagnetic compatibility (EMC)*; or
- (b) IEC 60945 - *Maritime navigation and radiocommunication equipment and systems – General requirements – Methods of testing and required test results*; or
- (c) LR Type Approval System – Test Specification Number 1;
- (d) Alternative national or international standard(s) acceptable to LR.

1.7.5 For areas susceptible to deluge or submersion, cable entries are to prevent water ingress. In general, cable entries are to be in accordance with IEC 60092-101: *Electrical Installations in Ships – Part 101: Definitions and General Requirements*.

1.8 Quality of power supplies

1.8.1 All electrical equipment supplied from the main and emergency sources of electrical power and electrical equipment for essential and emergency services supplied from d.c. sources of electrical power is to be so designed and manufactured that it is capable of operating satisfactorily under normally occurring variations of voltage and frequency.

1.8.2 Unless specified otherwise, a.c. electrical equipment is to operate satisfactorily with the following simultaneous variations, from their nominal value, when measured at the consumer input terminals:

(a) voltage:

- permanent variations +6 per cent –10 per cent
- transient variations due to step changes in load ± 20 per cent
- recovery time 1,5 seconds

(b) frequency:

- permanent variations ± 5 per cent
- transient variations due to step changes in load ± 10 per cent
- recovery time 5 seconds
- A maximum rate of change of frequency not exceeding $\pm 1,5$ Hz per second during cyclic frequency fluctuations.

1.8.3 Unless specified otherwise, the total harmonic distortion (THD) of the voltage waveform at any a.c. switchboard or section-board is not to exceed 8 per cent of the fundamental for all frequencies up to 50 times the supply frequency and no voltage at a frequency above 25 times supply frequency is to exceed 1,5 per cent of the fundamental of the supply voltage. THD is the ratio of the rms value of the harmonic content to the rms value of the fundamental, expressed in per cent and may be calculated using the expression:

$$THD = \frac{\sqrt{\sum_{h=2}^{\infty} V_h^2}}{V_1} \times 100$$

where

V_h = rms amplitude of a harmonic voltage of order h

V_1 = rms amplitude of the fundamental voltage.

1.8.4 Where a higher value of THD is specified, all installed equipment and systems are to be designed for the higher specified limit. This relaxation on the limit is to be documented in the harmonic distortion calculation report.

1.8.5 Unless specified otherwise, d.c. electrical equipment is to operate satisfactorily with the following simultaneous variations from their nominal value, when measured at the consumer input terminals:

(a) When supplied by d.c. generator(s) or a rectified a.c. supply:

Voltage tolerance (continuous)	±10 per cent
Voltage cyclic variation deviation	5 per cent
Voltage ripple	10 per cent

(a.c. rms over steady state o.c. voltage)

(b) When supplied by batteries:

- (i) Equipment connected to the batteries during charging: Voltage tolerance +30 per cent, –25 per cent;
- (ii) Equipment not connected to batteries during charging: Voltage tolerance +20 per cent, –25 per cent.

Different voltage variations as determined by the charging/discharging characteristics, including ripple voltage from the charging device, may be considered. When battery chargers/battery combinations are used as d.c. power supply systems adequate measures are to be taken to keep the voltage within the specified limits during charging, boost charging and discharging of the battery.

1.9 Ambient reference and operating conditions

1.9.1 The rating for classification purposes of essential electrical equipment intended for installation in ships to be classed for unrestricted (geographical) service is to be based on an engine room ambient temperature of 45°C, and a sea-water temperature at the inlet of 32°C. The equipment manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

1.9.2 In the case of a ship to be classed for restricted service, the rating is to be suitable for the ambient conditions associated with the geographical limits of the restricted service, see *Pt 1, Ch 2 Classification Regulations*.

1.9.3 Main and essential auxiliary machinery and equipment is to operate satisfactorily under the conditions shown in *Pt 5, Ch 1, 3.6 Ambient operating conditions*. Electrical equipment satisfying alternative ambient operating condition requirements for installation on ships contained in an acceptable and relevant National or International Standard may be considered to satisfy this requirement.

Note Details of local environmental conditions are stated in Annex B of IEC 60092-101-2002: *Electrical installations in ships – Part 101: Definitions and general requirements*.

1.9.4 Where electrical equipment is installed within environmentally controlled spaces, the ambient temperature for which the equipment is suitable for operation at its rated capacity may be reduced to a value not less than 35°C provided:

- the equipment is not for use for emergency services and is located outside of machinery space(s);
- temperature control is achieved by at least two cooling units so arranged that, in the event of loss of one cooling unit, for any reason, the remaining unit(s) will be capable of satisfactorily maintaining the design temperature;
- the equipment is able to be initially set to work safely within a 45°C ambient temperature until such a time that the lesser ambient temperature may be achieved; the cooling equipment is to be rated for an ambient temperature of not less than 45°C; and
- alarms are provided, at a continually attended control station, to indicate any malfunction of the cooling units.

See also *Pt 6, Ch 1, 1.4 Control, alarm and safety equipment 1.4.3*.

1.9.5 Where equipment is to comply with *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions 1.9.4*, it is to be ensured that electrical cables for their entire length are adequately rated for the maximum ambient temperature to which they are exposed along their length.

1.9.6 Equipment used for cooling and maintaining the lesser ambient temperature in accordance with *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions 1.9.4* are considered essential services and are to satisfy the requirements of *Pt 6, Ch 2, 5.2 Essential services*.

1.10 Inclination of ship

1.10.1 Emergency and essential electrical equipment is to operate satisfactorily under the conditions as shown in *Table 2.1.1 Inclination of ship*.

1.10.2 In ships for the carriage of liquefied gas the emergency source of electrical power is also to remain operable under the conditions described in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases), LR 10.2-04 . In ships for the carriage of liquid chemicals the emergency source of electrical power is also to remain operable under the conditions described in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals), LR 10.1(e).

1.10.3 Any proposal to deviate from the angles given in *Table 2.1.1 Inclination of ship* will be specially considered taking into account the type, size and service of the ship.

Table 2.1.1 Inclination of ship

Installations, components	Angle of inclination, degrees, see Note 2			
	Athwartships		Fore-and-aft	dynamic
	static	dynamic	static	
Essential electrical equipment	15	22,5	5 see Note 3	7,5
Safety systems, e.g. emergency power installations, crew and passenger safety systems Switchgear, electrical and electronic appliances see Note 1	22,5 See Note 4	22,5 See Note 4	10	10
<p>Note 1. No undesired switching operations or operational changes may occur.</p> <p>Note 2. Athwartships and fore-and-aft inclinations may occur simultaneously.</p> <p>Note 3. Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as: $\frac{500}{L} \text{ degrees}$ where L = Rule length, in metres see <i>Pt 3, Ch 1, 6.1 Principal particulars</i>.</p> <p>Note 4. In ships for the carriage of liquefied gas and of liquid chemicals the emergency source of electrical power is to remain operable with the ship flooded to a final athwartships inclination to a maximum angle of 30 degrees, in accordance with statutory requirements.</p>				

1.10.4 The dynamic angles of inclination in *Table 2.1.1 Inclination of ship* may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the electrical equipment is capable of operating under these angles of inclination.

1.11 Location and construction

1.11.1 All electrical equipment is to be constructed or selected, and installed such that:

- (a) live parts cannot be inadvertently touched, unless they are supplied at the safety voltage specified in *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.2.(h)*;
- (b) it does not cause injury when handled or touched in the normal manner; and
- (c) it is unaffected by any water, steam or oil and oil vapour to which it is likely to be exposed.

Electrical equipment having, as a minimum, the degrees of protection as specified in IEC 60092-201: *Electrical Installations In Ships – Part 201: System Design – General* for the relevant location will satisfy these requirements.

1.11.2 Laser light sources for optical fibre systems are to be constructed in accordance with IEC 60825-1, *Safety of laser products – Part 1: Equipment classification and requirements*. Acceptance of alternative standards will be subject to consideration by LR.

1.11.3 Optical fibre communication systems are to be constructed in accordance with IEC 60825-2, *Safety of laser products – Part 2: Safety of optical fibre communication systems*. Acceptance of alternative standards will be subject to consideration by LR.

1.11.4 Switchboards, section boards and distribution boards supplying essential and emergency services, as well as cables from the respective generators to and between these boards, are to be arranged to avoid areas of high fire risk and elevated temperatures, for example, in close proximity to incinerators and boilers.

1.11.5 Electrical equipment, as far as is practicable, is to be located:

- (a) such that it is accessible for the purpose of maintenance and survey;
- (b) clear of flammable material;
- (c) in spaces adequately ventilated to remove the waste heat liberated by the equipment under full load conditions, at the ambient conditions specified in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*;
- (d) where flammable gases cannot accumulate. If this is not practicable, electrical equipment is to be of the appropriate 'safe-type', see *Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts*;
- (e) where it is not exposed to the risk of mechanical injury or damage from water, steam or oil.

1.11.6 Equipment design and the choice of materials are to reduce the likelihood of fire, ensuring that:

- (a) where the electrical energised part can cause ignition and fire, it is contained within the bounds of the enclosure of the electrotechnical product;
- (b) the design, material(s) and construction of the enclosure minimises, as far as is practicable, any internal ignition causing ignition of adjacent materials; and
- (c) where surfaces of the electrotechnical products can be exposed to external fire, they do not, as far as practicable, contribute to the fire growth.

Note Compliance with IEC 60695: *Fire hazard testing* (all parts), or an alternative and acceptable Standard, will satisfy this requirement.

1.11.7 Insulating materials and insulated windings are to be resistant to tracking, moisture, sea air, oil and oil vapour unless special precautions are taken to protect them.

1.11.8 The minimum creepage and clearance distances provided for electrical connections, terminals and similar bare live parts are to be in accordance with a relevant International or National Standard for the equipment or apparatus concerned. In cases where the rated voltage is outside that given in the Standard or where no Standard is available, the minimum creepage and clearance distances provided are to be in accordance with 7.5. Details of alternatives proposals including supporting design rationale and demonstration may be submitted for consideration.

1.11.9 Studs, screw-type or spring-type clamp terminations, satisfactory for the normal operating currents and voltages, are to be provided in electrical equipment for the connection of external cable, or busbar conductors, as appropriate, see also *Pt 6, Ch 2, 11.15 Electric cable ends*. There is to be adequate space and access for the terminations.

1.11.10 The design of equipment is to enable ease of access to all parts requiring inspection or replacement in service.

1.11.11 Equipment is not to remain alive through the control circuits and/or pilot lamps when switched off by the control switch. This does not apply to synchronising switches and/or plugs.

1.11.12 The operation of all electrical equipment and the lubrication arrangements are to be efficient under such conditions of vibration and shock as arise in normal practice.

1.11.13 All nuts, screws and clamping devices used in connection with current-carrying, supporting and working parts are to be provided with means to ensure that they cannot work loose by vibration and shock as arise in normal practice.

1.11.14 To allow ease of access, connectors are to be spaced far enough apart to permit connection and disconnection. At test points, adequate clearance is to be provided between connection points and controls to provide access for testing.

1.11.15 Conductors and equipment are to be placed at such a distance from the magnetic compasses, or are to be so disposed, that the interfering magnetic field is negligible when circuits are switched on and off.

1.11.16 Where electrical power is used for propulsion, the equipment is to be so arranged that it will operate satisfactorily in the event of partial flooding by bilge water above the tank top up to the bottom floor plate level, under the normal angles of inclination given in *Pt 6, Ch 2, 1.10 Inclination of ship* for essential electrical equipment, see *Pt 5, Ch 13 Ship Piping Systems*.

1.12 Earthing of non-current carrying parts

1.12.1 Except where exempted by *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.2*, all non-current-carrying exposed metal parts of electrical equipment and cables are to be earthed for personnel protection against electric shock. Bonding

of non-current carrying exposed metal parts is to give a substantially equal potential and a sufficiently low earth fault loop impedance to ensure correct operation of protective devices.

1.12.2 The following parts may be exempted from the requirements of *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.1*:

- (a) lamp-caps, where suitably shrouded;
- (b) shades, reflectors and guards supported on lampholders or light fittings constructed of, or shrouded in, non-conducting material;
- (c) metal parts on, or screws in or through, non-conducting materials, which are separated by such material from current-carrying parts and from earthed non-current carrying parts in such a way that in normal use they cannot become live or come into contact with earthed parts;
- (d) apparatus which is constructed in accordance with the principle of double insulation;
- (e) bearing housings which are insulated in order to prevent circulation of current in the bearings;
- (f) clips for fluorescent lamps;
- (g) cable clips and short lengths of pipes for cable protection;
- (h) apparatus supplied at a safety voltage not exceeding 50 V d.c. or 50 V a.c., between conductors, or between any conductor and earth in a circuit isolated from the supply. Autotransformers are not to be used for the purpose of achieving the alternating current voltage;
- (i) apparatus or parts of apparatus which although not shrouded in insulating material is nevertheless otherwise so guarded that it cannot be touched and cannot come in contact with exposed metal.

1.12.3 Where extraneous-conductive parts (i.e. parts not forming part of the electrical installation and liable to introduce an electric potential) are not bonded by separate earthing conductors, details are to be submitted that demonstrate that a permanent, metal-to-metal connection of negligible impedance, which will not degrade due to corrosion or vibration, will be achieved.

1.12.4 Armouring, braiding and other metal coverings of cables are to be effectively earthed. Where the armouring, braiding and other metal coverings are earthed at one end only, they are to be adequately protected and insulated at the unearthed end with the insulation being suitable for the maximum voltage that may be induced. See *Pt 6, Ch 2, 14.9 Cable and cable installation 14.9.3* for earthing of cables in hazardous zones or spaces.

1.12.5 The electrical continuity of all metal coverings of cables throughout the length of the cable, particularly at joints and tapplings, is to be ensured.

1.12.6 Metal parts of portable appliances, other than current-carrying parts and parts exempted by *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.2* are to be earthed by means of an earth-continuity conductor in the flexible cable or cord through the associated plug and socket-outlet.

1.12.7 Earthing conductors are to be of copper or other corrosion-resistant material and be securely installed and protected where necessary against damage and also, where necessary, against electrolytic corrosion. Connections are to be so secured that they cannot work loose under vibration.

1.12.8 The nominal cross-section areas of copper earthing conductors for electrical equipment are, in general to be equal to the cross-section of the current-carrying conductor up to 16 mm², with a minimum of 1,5 mm². Above this figure they are to be equal to at least half the cross-section of the current-carrying conductor with a minimum of 16 mm².

1.12.9 The nominal cross-section areas of copper earthing conductors for armouring, braiding and other metal coverings of cables are, in general, to be equal to the equivalent cross-section of the armouring, braiding and other metal coverings with a minimum of 1,5 mm².

1.12.10 Earthing conductors of materials other than copper are to have a conductance not less than that specified for an equivalent copper earthing conductor.

1.12.11 The connection of the earthing conductor to the hull of the ship is to be made in an accessible position, and is to be secured by a screw or stud of a diameter appropriate for the size of earthing conductor, but not less than 6 mm, which is to be used for this purpose only. Bright metallic surfaces at the contact areas are to be ensured immediately before the nut or screw is tightened and, where necessary, the joint is to be protected against electrolytic corrosion. The connection is to remain unpainted.

1.13 Bonding for the control of static electricity

1.13.1 Bonding straps for the control of static electricity are required for cargo tanks, process plant and piping systems, for flammable products and solids liable to release flammable gas and/or combustible dust, which are not permanently connected to

the hull of the ship either directly or via their bolted or welded supports and where the resistance between them and the hull exceeds 1 MΩ.

1.13.2 Where bonding straps are required for the control of static electricity, they are to be robust, that is, having a cross-sectional area of at least 10 mm², and are to comply with *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.7* and *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.11*.

1.14 Alarms

1.14.1 Where alarms are required by this Chapter they are to be arranged in accordance with *Pt 6, Ch 1, 2.3 Alarm systems, general requirements*. Sound signal equipment, fire and general alarm bells are not required to be supplemented by visual indications, except in areas having high levels of background noise, such as machinery spaces.

1.14.2 The alarms in this Chapter are additional to those required by *Pt 6, Ch 1 Control Engineering Systems*. They may however form part of the alarm system that is required by *Pt 6, Ch 1 Control Engineering Systems*.

1.14.3 Cables for emergency alarms and their power sources are to be in accordance with *Pt 6, Ch 2, 1.16 Operation under fire conditions*.

1.14.4 Electrical equipment and cables for emergency alarms are to be so arranged that the loss of alarms in any one area due to localised fire, collision, flooding or similar damage is minimised, see *Pt 6, Ch 2, 1.16 Operation under fire conditions* and *Pt 6, Ch 2, 1.17 Operation under flooding conditions*.

1.14.5 Electric system: Alarms and safeguards are indicated in *Table 2.1.2 Electric system: Alarms and safeguards*.

Table 2.1.2 Electric system: Alarms and safeguards

Item	Alarm	Note
Busbar voltage	High and low	–
Busbar frequency	Low	–
Operation of load shedding	Warning	–
Generator cooling air temperature	High	For closed air circuit water-cooled machines

1.15 Labels, signs and notices

1.15.1 Labels, signs and notices required by this Chapter are to be positioned in clearly visible locations which will not be obscured.

1.15.2 Labels, signs and notices are to be easy to read under the expected operating conditions. Character height in accordance with *Table 2.1.3 Character height and viewing distance* will be considered to satisfy this requirement.

Table 2.1.3 Character height and viewing distance

Viewing distance (mm)	Minimum character height (mm)
Less than 500	2,3
500 – 1000	4,7
1000 – 2000	9,4
2000 – 4000	19
4000 – 8000	38

1.15.3 Controls, indicators and displays required by this Chapter are to be labelled to indicate their function. Labels are to be positioned in a manner that associates the label with the item being labelled.

1.15.4 Labels, signs and notices are to use short, clear messages. In general, warning signs and notices are to comprise:

- a signal word to convey the gravity of the risk (e.g. Danger, Warning or Caution);
- a statement of the nature and/or consequence of the hazard; and
- wherever practical, an instruction giving appropriate behaviour to avoid the hazard.

1.16 Operation under fire conditions

1.16.1 As a minimum, the following emergency services and their emergency power supplies, are required to be capable of being operated under fire conditions:

- Control and power systems to power-operated fire doors and status indication for all fire doors.
- Control and power systems to power-operated watertight doors and their status indication.
- Emergency lighting.
- Fire and general emergency alarms.
- Fire detection systems.
- Fire-extinguishing systems and fire-extinguishing media release alarms.
- Fire safety stops, see also *Pt 6, Ch 2, 17.6 Fire safety stops*.
- Low location lighting, see also *Pt 6, Ch 2, 18.4 Escape route or low location lighting (LLL) 18.4.3*.
- Public address systems.
- Emergency fire pump.

1.16.2 Where cables for the emergency services listed in *Pt 6, Ch 2, 1.16 Operation under fire conditions 1.16.1* pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be so arranged that a fire in any of these areas or zones does not affect the operation of the emergency service in any other area or zone. This may be achieved either by:

- cables being of a fire resistant type complying with *Pt 6, Ch 2, 11.5 Construction 11.5.3*, and at least extending from the main control/monitoring panel to the nearest local distribution panel serving the relevant area or zone; or
- there being at least two-loops/radial distributions run as widely apart as is practicable and so arranged that in the event of damage by fire at least one of the loops/radial distributions remains operational.

1.16.3 Where the cables for the power supplies for the emergency services listed in *Pt 6, Ch 2, 1.16 Operation under fire conditions 1.16.1* pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be of a fire resistant type complying with *Pt 6, Ch 2, 11.5 Construction 11.5.3*, extending at least to the local distribution panel serving the relevant area or zone.

1.16.4 Fire resistant electrical cables for the emergency services listed in *Pt 6, Ch 2, 1.16 Operation under fire conditions 1.16.1*, including their power supplies, are to be run as directly as is practicable, having regard to any special installation requirements, for example those concerning minimum bend radii.

1.16.5 In addition to *Pt 6, Ch 2, 1.11 Location and construction 1.11.6*, materials used for electrical equipment, cables and accessories within passenger accommodation areas are not to be capable of producing excessive quantities of smoke and toxic products.

1.16.6 NOTE:

Compliance with IEC 60695: *Fire hazard testing* (all parts) , or an alternative and acceptable Standard, will satisfy this requirement.

1.17 Operation under flooding conditions

1.17.1 Flooding of spaces along the ship bottom that are not fitted with a double bottom is not to result in the loss of the ability to provide electrically operated fire, ship, crew and passenger emergency safety systems outside of the spaces.

1.17.2 Installation of electrical equipment necessary to provide fire, ship, crew and passenger emergency safety systems in spaces along the ship bottom not fitted with a double bottom is to be avoided, wherever practical. Where it is proposed to install electrical equipment, including cabling, necessary to provide fire, ship, crew and passenger emergency safety systems in such spaces, evidence is to be submitted to demonstrate that required emergency services will be available in other spaces in the event of flooding of the space not fitted with a double bottom.

1.18 Protection of electrical equipment against the effects of lightning strikes

1.18.1 Precautions are to be taken to protect essential electronic equipment that may be susceptible to damage from voltage pulses attributable to the secondary effects of lightning. This may be achieved by suitable design and/or the use of additional

protective devices, such as surge arrestors. Resultant induced voltages may be further reduced by the use of earthed metallic screened cables. *See also Pt 6, Ch 2, 20 Lightning conductors.*

1.19 Programmable electronic systems

1.19.1 Where programmable electronic systems are implemented and used to control the electrical installation, or to provide safety functions in accordance with the requirements of this Chapter (e.g. electric propulsion, circuit-breaker settings, switchgear and controlgear controllers, etc.), the arrangements are to satisfy the applicable requirements of *Pt 6, Ch 1, 2.10 Programmable electronic systems - General requirements to Pt 6, Ch 1, 2.14 Programmable electronic systems – Additional requirements for integrated systems.*

1.19.2 Where *Pt 6, Ch 2, 1.19 Programmable electronic systems 1.19.1* applies, proposed modifications to software and acceptance testing and trials are to be in accordance with *Pt 6, Ch 1, 1.5 Alterations and additions* and *Pt 6, Ch 2, 7 Switchgear and controlgear assemblies* as applicable.

■ **Section 2** **Main source of electrical power**

2.1 General

2.1.1 The main source of electrical power is to comply with the requirements of this Section and SOLAS Ch II-1, Part D, *Regulation 41 - Main source of electrical power and lighting systems* and *Regulation 42 - Emergency source of electrical power in passenger ships* without recourse to the emergency source of electrical power.

2.2 Number and rating of generators and converting equipment

2.2.1 Under sea-going conditions, the number and rating of service generating sets and converting sets, such as transformers and semi-conductor converters, when any one generating set or converting set is out of action, are:

- (a) to be in accordance with SOLAS Ch II-1, Part D, *Regulation 41 - Main source of electrical power and lighting systems*, Section 1.2 and to be sufficient to ensure operation of cargo refrigeration machinery of ships having an **RMC** notation and the container socket outlets and ventilation system of container ships having a **CRC** notation. *See Pt 6, Ch 2, 16.3 Power requirements 16.3.5* for electric propulsion systems;
- (b) to have sufficient reserve capacity to permit the starting of the largest motor without causing any motor to stall or any device to fail due to excessive voltage drop on the system;
- (c) to be capable of providing the electrical services necessary to start the main propulsion machinery from a dead ship condition in accordance with SOLAS Ch II-1, Part D, *Regulation 41 - Main source of electrical power and lighting systems*, Section 1.4.

2.2.2 The arrangement of the ship's main source of power is to be such that the operation of electrical services including cargo refrigeration machinery of ships having an RMC notation is to be in accordance with SOLAS Ch II-1, Part D *Regulation 41 - Main source of electrical power and lighting systems*, Section 1.3.

2.2.3 Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by one generating set, arrangements are to be provided to prevent overloading of the running generator, *see Pt 6, Ch 2, 6.9 Load management*. On loss of power there is to be provision for automatic starting and connecting to the main switchboard of the standby set in as short a time as practicable, but in any case within 45 seconds, and automatic sequential restarting of essential services, *see Pt 6, Ch 2, 1.6 Definitions 1.6.1*, in as short a time as is practicable. In addition ships are to comply with SOLAS Ch II-1, Part D, *Regulation 41 - Main source of electrical power and lighting systems*, Section 5

Note Where the prime mover starting time will result in exceeding this starting and connection time, details are to be submitted for consideration.

2.3 Starting arrangements

2.3.1 The starting arrangements of the generating sets prime movers are to comply with the requirements of *Pt 5, Ch 2, 9 Starting arrangements* as applicable.

2.3.2 Where the emergency source of electrical power is required to be used to restore propulsion from a 'dead ship condition' it is to be in accordance with SOLAS Ch II-1, Part D, *Regulation 42 - Emergency source of electrical power in*

passenger ships, Section 3.4, in addition to supplying those services in *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1*, for passenger ships and *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1* for cargo ships. See *Pt 5, Ch 2, 9.1 Dead ship condition starting arrangements 9.1.1* for dead ship condition starting arrangements.

2.4 Prime mover governors

2.4.1 The governing accuracy of the generating sets prime movers is to meet the requirements of *Pt 5, Ch 2, 7.3 Auxiliary and emergency engine governors*.

2.4.2 The maximum electrical step load switched on or off is not to cause the frequency variation of the electrical supply to exceed the parameters given in *Pt 6, Ch 2, 1.8 Quality of power supplies 1.8.2*.

2.5 Main propulsion driven generators not forming part of the main source of electrical power

2.5.1 Generators and generator systems having the ship's propulsion machinery as their prime mover but not forming part of the ship's main source of electrical power may be used whilst the ship is at sea to supply electrical services required for normal operational and habitable conditions provided that the requirements of *Pt 6, Ch 2, 2.5 Main propulsion driven generators not forming part of the main source of electrical power 2.5.2* to *Pt 6, Ch 2, 2.5 Main propulsion driven generators not forming part of the main source of electrical power 2.5.4* are satisfied.

2.5.2 Within the declared operating range of the generators and/or generator system, the specified voltage and frequency variations of the Rules are to be met.

2.5.3 Where there is remote control of the propulsion machinery, arrangements are to ensure that essential machinery power supplies are maintained during manoeuvring conditions in order to prevent a blackout situation.

2.5.4 In addition to the requirements of *Pt 6, Ch 2, 2.2 Number and rating of generators and converting equipment 2.2.3*, arrangements are to be fitted to automatically start one of the generators forming the main source of power should the frequency variations exceed those permitted by the Rules.

■ **Section 3** **Emergency source of electrical power**

3.1 General

3.1.1 The requirements of this Section apply to passenger and cargo ships to be classed for unrestricted service. They do not apply to cargo ships of less than 500 tons gross tonnage.

3.1.2 For ships assigned a Service Restriction Notation in accordance with *Pt 1, Ch 2 Classification Regulations*, a lesser period than the 36 hour period and 18 hour period specified in *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships* and *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships* respectively may be considered, but not less than 12 hours.

3.1.3 The emergency source of power for cargo ships of less than 500 tons gross tonnage will be the subject of special consideration.

3.2 Emergency source of electrical power in all ship types

3.2.1 All ships are to comply with the requirements as described in SOLAS II-1, Part D, *Regulation 40 - General* and *Regulation 41 - Main source of electrical power and lighting systems* except where expressly provided.

3.2.2 Where compliance with *Pt 6, Ch 2, 3.2 Emergency source of electrical power in all ship types 3.2.1* is not practicable, details of the proposed design and arrangements are to be submitted for consideration in accordance with SOLAS II-1, Part F, *Regulation 55 Alternative design and arrangements*.

3.3 Emergency source of electrical power in passenger ships

3.3.1 Passenger ships are to comply with the requirements as described in SOLAS II-1, Part D, *Regulation 42 - Emergency source of electrical power in passenger ships* and *Regulation 42-1 - Supplementary emergency lighting for ro-ro passenger ships* as applicable.

3.3.2 In passenger ships, supplementary lighting is to be provided in all cabins to indicate clearly the exit so that occupants will be able to find their way to the door as described in SOLAS II-1, Part D, *Regulation 41 - Main source of electrical power and lighting systems*.

3.3.3 Where compliance with *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1* and *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.2* is not practicable, details of the proposed design and arrangements are to be submitted for consideration in accordance with SOLAS II-1, Part F, *Regulation 55 Alternative design and arrangements*.

3.4 Emergency source of electrical power in cargo ships

3.4.1 Cargo ships are to comply with the requirements as described in SOLAS II-1, Part D, *Regulation 43 - Emergency source of electrical power in cargo ships*.

3.4.2 Where compliance with *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1* is not practicable, details of the proposed design and arrangements are to be submitted for consideration in accordance with SOLAS II-1, Part F, *Regulation 55 Alternative design and arrangements*.

3.5 Starting arrangements

3.5.1 Where the emergency source of power is a generator, the starting arrangements are to comply with the requirements given in SOLAS II-1, Part D, *Regulation 44 - Starting arrangements for emergency generating sets*.

3.6 Prime mover governor

3.6.1 Where the emergency source of power is a generator, the governor is to comply with *Pt 6, Ch 2, 2.4 Prime mover governors*.

3.7 Sources of Energy for Radio installation

3.7.1 The sources of energy required for each radio installation as required by SOLAS 1974 as amended, Chapter IV, *Part C - Ship requirements*, are to comply with SOLAS 1974 as amended, Chapter IV, Part C, *Regulation 13 - Sources of energy*.

■ **Section 4** **External source of electrical power**

4.1 Temporary external supply

4.1.1 Where arrangements are made for the supply of electricity from a source on shore or elsewhere, a connection box is to be installed in a position suitable for the convenient reception of flexible cables from the external source and containing a circuit-breaker or isolating switch and fuses and terminals including one earthed, of ample size and suitable shape to facilitate a satisfactory connection of three-phase external supplies with earthed neutrals.

4.1.2 Suitable cables, permanently fixed, are to be provided, connecting the terminals in the connection box to a linked switch and/or a circuit-breaker at the main switchboard. An indicator is to be provided at the main switchboard in order to show when the cables are energised.

4.1.3 Means are to be provided for checking the phase sequence of the incoming supply.

4.1.4 At the connection box a notice is to be provided giving full information on the system of supply, the normal voltage and frequency of the installation's system and the procedure for carrying out the connection.

4.1.5 Alternative arrangements may be submitted for consideration. See also *Pt 7, Ch 13 On-shore Power Supplies* for class notation **OPS**.

4.2 Permanent external supply

4.2.1 Details are to be submitted.

■ Section 5 Supply and distribution

5.1 Systems of supply and distribution

5.1.1 The following systems of generation and distribution are acceptable, other than for tankers intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test):

- (a) d.c., two-wire,
- (b) a.c., single-phase, two-wire;
- (c) a.c., three-phase;
 - (i) three-wire;
 - (ii) four-wire with neutral solidly earthed but without hull return.

5.1.2 For tankers intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test) only the following systems of generation and distribution are acceptable:

- (a) d.c., two-wire, insulated;
- (b) a.c., single-phase, two-wire, insulated;
- (c) a.c., three-phase, three-wire, insulated;
- (d) earthed systems, a.c. or d.c., limited to areas outside any hazardous space or zone, and arranged so that no current arising from an earth-fault in any part of the system could pass through a hazardous space or zone;
- (e) earthed systems, complying with *Pt 6, Ch 2, 5.1 Systems of supply and distribution 5.1.1* and *Pt 6, Ch 2, 5.5 Earthed distribution systems 5.5.7*, provided the Government of the Flag State permits such an arrangement in accordance with the 'Equivalents' provisions of SOLAS Chapter I - General provisions, Regulation 5, see *Ch 1, 1.4 Equivalents* of the Rules for Ships for Liquid Chemicals and/or the the Rules for Ships for Liquefied Gases, as appropriate, see also *Pt 6, Ch 2, 14.1 General 14.1.2*.

Earthed intrinsically safe circuits are permitted to pass into and through hazardous spaces and zones.

5.1.3 System voltages for both alternating current and direct current in general are not to exceed:

- 15 000 V for generation and power distribution;
- 500 V for cooking and heating equipment permanently connected to fixed wiring;
- 250 V for lighting, heaters in cabins and public rooms, and other applications not mentioned above.

Voltages above these will be the subject of special consideration.

5.1.4 The arrangement of the main system of supply is to be such that a fire or other casualty in any space containing the main source of electrical power, associated converting equipment, if any, the main switchboard and the main lighting switchboard will not render inoperable any emergency service, other than those located within the space where the fire or casualty has occurred.

5.1.5 The main switchboard is to be so placed relative to the main source of power that, as far as is practicable, the integrity of the main system of supply will be affected only by a fire or other casualty in one space.

5.1.6 The arrangement of the emergency system of supply is to be such that a fire or other casualty in spaces containing the emergency source of electrical power, associated converting equipment, if any, the emergency switchboard and the emergency lighting switchboard, will not cause loss of services required to maintain the propulsion and safety of the ship.

5.1.7 Distribution systems required in an emergency are to be so arranged that a fire in any one main fire zone, as defined by SOLAS 1974 as amended *Regulation 3 - Definitions*, will not interfere with the emergency distribution in any other such zone.

5.2 Essential services

5.2.1 Essential services that are required by *Pt 5 Main and Auxiliary Machinery* to be duplicated are to be served by individual circuits, separated in their switchboard or section board and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies, so that any single fault will not cause the loss of both services.

5.2.2 Where *Pt 6, Ch 2, 5.2 Essential services 5.2.1* is applicable the main busbars of the switchboard, or section boards, are to be capable of being split, by a multipole linked circuit breaker, disconnecter or switch-disconnector, into at least two independent sections, each supplied by at least one generator, either directly or through a converter. The essential services are to be equally divided, as far as is practicable, between the independent sections.

5.2.3 Where *Pt 6, Ch 2, 5.2 Essential services 5.2.2* is applicable provision is to be made to transfer to a temporary circuit those essential services which are not required to be, and have not been, duplicated in the event of loss of their normal section of switchboard or section-board.

5.3 Isolation and switching

5.3.1 The incoming and outgoing circuits from every switchboard or section board are to be provided with a means of isolation and switching to permit each circuit to be switched off:

- (a) on load;
- (b) for mechanical maintenance;
- (c) in an emergency to prevent or remove danger.

In addition the requirements of *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.2* and *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.3* are to be complied with.

5.3.2 Isolation and switching is to be by means of a circuit-breaker or switch arranged to open and close simultaneously all insulated poles. Where a switch is used as the means of isolation and switching, it is to be capable of:

- (a) switching off the circuit on load;
- (b) withstanding, without damage, the overcurrents which may arise during overloads and short-circuit.

In addition, these requirements do not preclude the provision of single pole control switches in final sub-circuits, for example light switches. For circuit-breakers, see *Pt 6, Ch 2, 6.5 Circuit-breakers* and *Pt 6, Ch 2, 7.3 Circuit-breakers*.

5.3.3 Provision is to be made, in accordance with one of the following, to prevent any circuit being inadvertently energised:

- (a) the circuit-breaker or switch can be withdrawn, or locked in the open position;
- (b) the operating handle of the circuit-breaker or switch can be removed;
- (c) the circuit fuses, where fitted, can be readily removed and retained by authorised personnel.

5.3.4 Where arrangements are in place for automatic changeover between two or more supplies of electrical power in the event of failure of one supply, the arrangements are to be such that a fault in one feeder does not result in the loss of all supplies to the automatic changeover switch.

5.3.5 Where a section board, distribution board or item of equipment can be supplied by more than one circuit, a switching device is to be provided to permit each incoming circuit to be isolated and the supply transferred to the alternative circuit. In addition, the requirements of *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.6* and *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.7* are to be complied with.

5.3.6 The switching device required by *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.5* is to be situated within or adjacent to the section board, distribution board or item of equipment. Where necessary, interlocking arrangements are to be provided to prevent circuits being inadvertently energised.

5.3.7 A notice is to be fixed to any section board, distribution board or item of equipment to which *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.5* applies warning personnel before gaining access to live parts of the need to open the appropriate circuit-breakers or switches, unless an interlocking arrangement is provided so that all circuits concerned are isolated before access is gained.

5.3.8 Tankers designed in accordance with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features*, see *Pt 6, Ch 2, 14.1 General 14.1.2*, are to meet the requirements of *Pt 6, Ch 2, 5.3 Isolation and switching* of that Standard.

5.3.9 Where high voltage equipment is contained in a room or protected area which also forms its enclosure, the access door(s) of the space is to be so interlocked that it cannot be opened until:

- the high voltage supply(ies) to the equipment is switched off;
- the equipment and its cable(s) are earthed down to dissipate stored energy sufficient to ensure personnel safety.

5.3.10 The access to the space(s) described in *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.9* are to be suitably marked to indicate the danger of high voltage.

5.4 Insulated distribution systems

5.4.1 A device(s) is to be installed for every insulated distribution system, whether primary or secondary, for power, heating and lighting circuits, to continuously monitor the insulation level to earth and to operate an alarm in the engine control room, or equivalent attended position, in the event of an abnormally low level of insulation resistance, *see also Pt 6, Ch 1, 4.2 Alarm system for machinery*.

5.4.2 Where any insulated lower voltage system is supplied through transformers from a high voltage system, adequate precautions are to be taken to prevent the low voltage system being charged by capacitive leakage from the high voltage system.

5.4.3 Tankers designed in accordance with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features* (see Pt 6, Ch 2, 14.1 General 14.1.2) are to meet the requirements of Pt 6, Ch 2, 5.3 *Isolation and switching* of that Standard.

5.4.4 Where filters are fitted, for example to reduce EMC susceptibility, these are not to cause distribution systems to be unintentionally connected to earth.

5.5 Earthed distribution systems

5.5.1 No fuse, non-linked switch or non-linked circuit-breaker is to be inserted in an earthed conductor. Any switch or circuit-breaker fitted is to operate simultaneously in the earthed conductor and the insulated conductors. These requirements do not preclude the provision (for test purposes) of an isolating link to be used only when the other conductors are isolated.

5.5.2 For high voltage systems, where the earthed neutral system of generation and primary distribution is used, earthing is to be through an impedance in order to limit the total earth fault current to a magnitude which does not exceed that of the three phase short-circuit current for which the generators are designed.

5.5.3 Generator neutrals may be connected in common, provided that the third harmonic content of the voltage waveform of each generator does not exceed five per cent.

5.5.4 Where a switchboard is split into sections operated independently or where there are separate switchboards, neutral earthing is to be provided for each section or for each switchboard. Means are to be provided to ensure that the earth connection is not removed when generators are isolated.

5.5.5 A means of isolation is to be fitted in the earthing connection of each generator so that generators can be completely isolated for maintenance.

5.5.6 All earthing impedances are to be connected to the hull. The connections to the hull are to be so arranged that any circulating currents in the earth connections do not interfere with radio, radar, communication and control equipment circuits.

5.5.7 Tankers designed in accordance with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features* (see Pt 6, Ch 2, 14.1 General 14.1.2) are to meet the requirements of Pt 6, Ch 2, 5.3 *Isolation and switching* of that Standard.

5.6 Diversity factor

5.6.1 Circuits supplying two or more final sub-circuits are to be rated in accordance with the total connected load subject, where justified, to the application of a diversity factor. Where spare ways are provided on a section or distribution board, an allowance for future increase of load is to be added to the total connected load before application of any diversity factor.

5.6.2 A diversity factor may be applied to the calculation for size of cable and rating of switchgear and fusegear, taking into account the duty cycle of the connected loads and the frequency and duration of any motor starting loads.

5.6.3 For winches and crane motors the diversity factor is to be calculated and submitted when required.

5.7 Lighting circuits

5.7.1 Lighting circuits are to be supplied by final sub-circuits separate from those for heating and power. This does not preclude the supply from a lighting circuit supplying a single fixed appliance, such as a cabin fan, a dry shaver, a wardrobe or anti-condensation heater, taking a maximum current of 2 A.

5.7.2 Lighting for the following spaces is to be supplied from at least two final sub-circuits in such a way that failure of one of the circuits does not leave the space in darkness. One of these circuits may be an emergency circuit provided it is normally energised.

- Spaces that are required to be lit for the safe working of the ship, such as control stations, normal working spaces, etc.

- Spaces where there may be a hazard due to movement of crew, passengers and/or equipment, such as in corridors, working passage ways, stairways leading to boat decks, public rooms, etc.
- Spaces where there may be a hazard due to moving machinery and hot parts, such as in machinery spaces, workshops, large galleys, laundries, etc.

5.7.3 Lighting for enclosed hazardous spaces is to be supplied from at least two final sub-circuits to permit light from one circuit to be retained while maintenance is carried out on the other. One of these circuits may be an emergency circuit, provided it is normally energised in which case the arrangements are to comply with *Pt 6, Ch 2, 3 Emergency source of electrical power*.

5.7.4 Emergency lighting is to be fitted in accordance with *Pt 6, Ch 2, 3 Emergency source of electrical power*, see also *Pt 6, Ch 2, 18 Crew and passenger emergency safety systems*.

5.7.5 Lighting of unattended spaces, such as cargo spaces, is to be controlled by multipole linked switches situated outside such spaces. Provision is to be made for the complete isolation of these circuits, and locking the means of control in the off position.

5.7.6 Where lighting circuits in the cargo pump-rooms of tankers are also used for emergency lighting, and have been interlocked with the ventilation, the interlocking arrangements are:

- not to cause the lighting to go out following a failure of the ventilation system; and
- not to prevent operation of the emergency lighting following the loss of the main source of electrical power.

5.8 Motor circuits

5.8.1 A separate final sub-circuit is to be provided for every motor for essential services, see *Pt 6, Ch 2, 1.6 Definitions 1.6.1*.

5.9 Motor control

5.9.1 Every electric motor is to be provided with efficient means for starting and stopping so placed as to be easily operated by the person controlling the motor. Every motor above 0,5 kW is to be provided with control apparatus as given in *Pt 6, Ch 2, 5.9 Motor control 5.9.2*.

5.9.2 Means to prevent undesired restarting after a stoppage due to low volts or complete loss of volts are to be provided. This does not apply to motors where a dangerous condition might result from the failure to restart automatically, e.g. steering gear motor.

5.9.3 Means for automatic disconnection of the supply in the event of excess current due to mechanical overloading of the motor are to be provided, see also *Pt 6, Ch 2, 6.11 Motor circuits*.

5.9.4 Motor controlgear is to be suitable for the starting current and for the full load rated current of the motor.

5.10 Harmonic distortion measurement

5.10.1 The requirements of *Pt 6, Ch 2, 5.10 Harmonic distortion measurement* apply to electrical distribution systems that include harmonic filters. This requirement applies both to high voltage and low voltage busbars. See also *Pt 6, Ch 2, 6.13 Harmonic filters*. Harmonic filters associated with frequency drives for individual applications (i.e. pump motors) are excluded from the following requirements.

5.10.2 Means are to be provided to continuously monitor the levels of harmonic distortion experienced on the main busbars and to operate an alarm in the engine control room, or equivalent attended position, in the event that the harmonic distortion exceeds the acceptable limits, see also *Pt 6, Ch 1, 4.2 Alarm system for machinery*.

5.10.3 Where the engine room is provided with automation systems to continuously monitor the levels of harmonic distortion experienced on the main busbars, this reading is to be logged electronically; otherwise it is to be measured annually and after any modification to the craft electrical distribution system or associated consumers and recorded in the engine log book for future inspection by the Surveyor.

5.11 Harmonic filtering

5.11.1 The requirements in this Section apply to systems provided with harmonic filters. They apply in particular to, but are not limited to, electrical propulsion systems and are in addition to the requirements for harmonic filters in *Pt 6, Ch 2, 6.13 Harmonic filters*.

5.11.2 Filters used to control harmonic distortion are to keep the distortion within acceptable limits at the main supply. See also *Pt 6, Ch 2, 1.8 Quality of power supplies*.

-
- 5.11.3 The service life of the harmonic filter is to be declared, and details are to be included in the harmonic calculation report.
- 5.11.4 The temperature rating of the harmonic filter is to allow for the increased heating effect of the harmonic distortion.
- 5.11.5 The construction of cabinets for harmonic filters shall be in accordance with the standards for main switchboards, where applicable. *See also Pt 6, Ch 2, 7 Switchgear and controlgear assemblies.*
- 5.11.6 The modes of operation of the electrical distribution system for which harmonic distortion levels at the main switchboard busbars are maintained within the acceptable limits during normal operation are to be defined by the system integrator.
- 5.11.7 Harmonic distortion calculations are to include levels of harmonic distortion expected in normal operation and in the event of a failure of a harmonic filter or the failure of any combination of harmonic filters. *See also Pt 6, Ch 2, 21.2 Trials.*
-

■ Section 6

System design – Protection

6.1 General

- 6.1.1 Installations are to be protected against overcurrents including short-circuits, and other electrical faults. The tripping/fault clearance times of the protective devices are to provide complete and co-ordinated protection to ensure:
- (a) availability of essential and emergency services under fault conditions through discriminative action of the protective devices; as far as practicable the arrangements are also to secure the availability of other services;
 - (b) elimination of the fault to reduce damage to the system and hazard of fire.
- 6.1.2 Short-circuit and overload protection are to be provided in each non-earthed line of each system of supply and distribution, unless exempted under the provisions of any paragraph in this Section.
- 6.1.3 The protection of circuits is to be such that a fault in a circuit does not cause the interruption of supplies used to provide emergency or essential services other than those dependent on the circuit where the fault occurred. For circuits used to provide essential services which need not necessarily be in continuous operation to maintain propulsion and steering but which are necessary for maintaining the vessel's safety, arrangements that ensure that a fault in a circuit does not cause the sustained interruption of supply to healthy circuits may be accepted. Such arrangements are to ensure the supply to healthy circuits is automatically re-established in sufficient time after a fault in a circuit.
- 6.1.4 Protection systems are to be developed using a systematic design procedure incorporating verification and validation methods to ensure successful implementation of the requirements above. Details of the procedures used are to be submitted when requested. An approved copy of the details required by *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.5* and *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.6* is to be retained on board and made available to the Surveyor on request. Access to protection relays setpoints is to be restricted, such that they will generally only be adjusted by authorised personnel to avoid accidental operation. A record is to be kept of the initial setpoints and any subsequent changes made to them. These details are to be made available to the Surveyor on request.
- 6.1.5 Short-circuit protection is to be provided for each source of power and at each point at which a distribution circuit branches into two or more subsidiary circuits.
- 6.1.6 Where protection for generator power circuits is provided at the associated switchboard, the cabling between generator and switchboard is to be of a type, and installed in a manner such as to minimise the risk of short-circuit.
- 6.1.7 Protection for battery circuits is to be provided at a position external and adjacent to the battery compartments. Where arrangements comply with *Pt 6, Ch 2, 12.3 Location 12.3.5*, the protection may be installed at a suitable location in the battery compartment.
- 6.1.8 Protection may be omitted from the following:
- (a) Engine starting battery circuits.
 - (b) Circuits for which it can be shown that the risk resulting from spurious operation of the protective device may be greater than that resulting from a fault.
- 6.1.9 Short-circuit protection may be omitted from cabling or wiring to items of equipment internally protected against short-circuit or where it can be shown that they are unlikely to fail to a short-circuit condition and where the cabling or wiring is installed in a manner such as to minimise the risk of short-circuit.

6.1.10 Overload protection may be omitted from the following:

- (a) one line of circuits of the insulated type;
- (b) circuits supplying equipment incapable of being overloaded, or overloading the associated supply cable, under normal conditions, and unlikely to fail to an overload condition.

6.2 Protection against short-circuit

6.2.1 Protection against short-circuit currents is to be provided by circuit-breakers or fuses.

6.2.2 The rated short-circuit making and breaking capacity of every protective device is to be adequate for the prospective fault level at its point of installation; the requirements for circuit-breakers and fuses are detailed in *Pt 6, Ch 2, 6.5 Circuit-breakers* and *Pt 6, Ch 2, 6.6 Fuses* respectively.

6.2.3 The prospective fault current is to be calculated for the following set of conditions:

- (a) all generators, motors and, where applicable, all transformers, connected as far as permitted by any interlocking arrangements;
- (b) a fault of negligible impedance close up to the load side of the protective device.

6.2.4 In the absence of precise data, the prospective fault current may be taken to be:

- (a) for alternating current systems at the main switchboard: $10 \times \text{f.l.c.}$ (rated full load current) for each generator that may be connected, or, if the subtransient direct axis reactance, X''_d , of each generator is known,

$$\frac{\text{f.l.c.}}{X''_d(\text{p.u.})}$$

for each generator, and $3 \times \text{f.l.c.}$ for motors simultaneously in service.

The value derived from the above is an approximation to the r.m.s. symmetrical fault current; the peak asymmetrical fault current may be estimated to be 2,5 times this figure (corresponding to a fault power factor of approximately 0,1).

- (b) battery-fed direct current systems at the battery terminals:
 - (i) 15 times ampere hour rating of the battery for vented lead-acid cells, or of alkaline type intended for discharge at low rates corresponding to a battery duration exceeding three hours, or
 - (ii) 30 times ampere hour rating of the battery for sealed lead-acid cells having a capacity of 100 Ampere hours or more, or of alkaline type intended for discharge at high rates corresponding to a battery duration not exceeding three hours and,
 - (iii) $6 \times \text{f.l.c.}$ for motors simultaneously in service (if applicable).

6.3 Protection against overload

6.3.1 The characteristics of protective devices provided for overload protection are to ensure that cabling and electrical machinery are protected against overheating resulting from mechanical or electrical overload.

6.3.2 Fuses of a type intended for short-circuit protection only (e.g. high-voltage fuses or fuses complying with IEC 60269-1: *Low-voltage fuses – Part 1: General requirements*, of type 'a') are not to be used for overload protection.

6.4 Protection against earth faults

6.4.1 Every distribution system that has an intentional connection to earth, by way of an impedance, is to be provided with a means to continuously monitor and indicate the current flowing in the earth connection.

6.4.2 If the current in the earth connection exceeds 5 A there is to be an alarm and the fault current is to be automatically interrupted or limited to a safe value.

6.4.3 The rated short-circuit capacity of any device used for interrupting earth fault currents is to be not less than the prospective earth fault current at its point of installation.

6.4.4 Insulated neutral systems with harmonic distortion of the voltage waveform, which may result in earth fault currents exceeding the level given in *Pt 6, Ch 2, 6.4 Protection against earth faults 6.4.2* because of capacitive effects, are to be provided with arrangements to isolate the faulty circuit(s).

6.5 Circuit-breakers

6.5.1 Circuit-breakers for alternating current systems are to satisfy the following conditions:

- (a) the r.m.s. symmetrical breaking current for which the device is rated is to be not less than the r.m.s. value of the a.c. component of the prospective fault current, at the instant of contact separation (i.e. first half cycle, or time of interruption where an intentional time delay is provided to ensure suitability);
- (b) the peak asymmetrical making current for which the device is rated is not to be less than the peak value of the prospective fault current at the first half cycle, allowing for maximum asymmetry;
- (c) the power factor at which the device short-circuit ratings are assigned is to be no greater than that of the prospective fault current; alternatively for high voltage, the rated percentage d.c. component of the short-circuit breaking current of the device is to be not less than that of the prospective fault current.

6.5.2 Circuit-breakers for d.c. systems are to have a breaking current not less than the initial prospective fault current. The time constant of the fault current is not to be greater than that for which the circuit-breaker was tested.

6.5.3 The fault ratings considered in *Pt 6, Ch 2, 6.5 Circuit-breakers 6.5.1* and *Pt 6, Ch 2, 6.5 Circuit-breakers 6.5.2*, are to be assigned on the basis that the device is suitable for further use after fault clearance.

6.5.4 Circuit-breaker selection is, and ratings are, to be in accordance with the relevant requirements of IEC 60092- 202: *Electrical installations in ships – Part 202: System design – Protection*. Alternative methods acceptable to LR of selecting suitable circuit-breakers may be considered.

6.5.5 Where parallel filter circuits are to be used the current imbalance is to be monitored;

6.6 Fuses

6.6.1 Fuses for a.c. systems are to have a breaking current rating not less than the initial r.m.s. value of the a.c. component of the prospective fault current.

6.6.2 Fuses for d.c. systems are to have a d.c. breaking current rating not less than the initial value of the prospective fault current.

6.7 Circuit-breakers requiring back-up by fuse or other device

6.7.1 The use of a circuit-breaker having a short-circuit current capacity less than the prospective short-circuit current at the point of installation is permitted, provided that it is preceded by a device having at least the necessary short-circuit capacity. The generator circuit-breakers are not to be used for this purpose.

6.7.2 The same device may back-up more than one circuit-breaker provided that no essential or emergency service is supplied from there, or that any such service is duplicated by arrangements unaffected by tripping of the device.

6.7.3 The combination of back-up device and circuit-breaker is to have a short-circuit performance at least equal to that of a single circuit-breaker satisfying the requirements of *Pt 6, Ch 2, 6.5 Circuit-breakers*.

6.7.4 Evidence of testing of the combination is to be submitted for consideration; alternatively, consideration may be given to arrangements where it can be shown that:

- (a) the takeover current, above which the back-up device would clear a fault, is not greater than the rated short-circuit breaking capacity of the circuit-breaker and;
- (b) the characteristics of the back-up device, and the prospective fault level, are such that the peak fault current rating of the circuit-breaker cannot be exceeded and;
- (c) the Joule integral of the let-through current of the back-up device does not exceed that corresponding to the rated breaking current and opening time of the circuit-breaker.

6.8 Protection of generators

6.8.1 The protective gear required by *Pt 6, Ch 2, 6.8 Protection of generators 6.8.2* and *Pt 6, Ch 2, 6.8 Protection of generators 6.8.3* is to be provided as a minimum.

6.8.2 Generators not arranged to run in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of short-circuit, overload or under-voltage, all insulated poles. In the case of generators rated at less than 50 kW, a multipole linked switch with a fuse, complying with *Pt 6, Ch 2, 5.3 Isolation and switching 5.3.2*, in each insulated pole will be acceptable.

6.8.3 Generators arranged to operate in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an under-voltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in

accordance with the characteristics of the prime mover; a fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the breakers.

6.8.4 The generator circuit-breaker short-circuit and overload tripping arrangements, or fuse characteristics, are to be such that the machine's thermal withstand capability is not exceeded.

6.8.5 All high-voltage generators and low-voltage generators having a capacity of 1500 kVA or above are to be equipped with a protective device which, in the event of a short-circuit in the generator or in the cables between the generator and its circuit-breaker, will instantaneously open the circuit-breaker and de-excite the generator.

6.8.6 The voltage and time delay settings of the under-voltage release mechanism(s) required by:

- *Pt 6, Ch 2, 6.8 Protection of generators 6.8.2* and
- *Pt 6, Ch 2, 6.8 Protection of generators 6.8.3*

are to be chosen to maintain the discriminative action detailed in *Pt 6, Ch 2, 6.1 General*

6.9 Load management

6.9.1 Arrangements are to be made to disconnect automatically, after an appropriate time delay, circuits of the following categories, when the generator(s) is/are overloaded, sufficient to ensure the connected generating set(s) is/are not overloaded:

- (a) non-essential circuits;
- (b) circuits feeding services for habitability, see *Pt 6, Ch 2, 1.6 Definitions 1.6.2*;
- (c) in cargo ships, circuits for cargo refrigeration.

Note For emergency generators see *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1* and *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1* as applicable.

6.9.2 If required, this load switching may be carried out in one or more stages, in which case the non-essential circuits are to be included in the first group to be disconnected.

6.9.3 The load management of power systems supplying electric propulsion motors is to satisfy the requirements of *Pt 6, Ch 2, 16.3 Power requirements*.

6.9.4 Consideration is to be given to providing means to inhibit automatically the starting of large motors, or the connection of other large loads, until sufficient generating capacity is available to supply them.

6.10 Feeder circuits

6.10.1 Isolation and protection of each feeder circuit is to be ensured by a multipole circuit-breaker or linked switch with a fuse in each insulated conductor. Protection is to be in accordance with *Pt 6, Ch 2, 6.2 Protection against short-circuit* and *Pt 6, Ch 2, 6.3 Protection against overload*. The protective devices are to allow excess current to pass during the normal accelerating period of motors.

6.11 Motor circuits

6.11.1 Motors of rating exceeding 0,5 kW and all motors for essential services are to be protected individually against overload and short-circuit. For motors which for essential services are duplicated, the overload protection may be replaced by an overload alarm; arrangements for steering gear motors are to comply with *Pt 6, Ch 2, 15.1 Steering gear*.

6.11.2 Protection for both the motor and its supply cable may be provided by the same device, provided that due account is taken of any differences between ratings of cable and motor.

6.11.3 Where operation of an item of equipment is dependent upon a number of motors, consideration may be given to the provision of a common means of short-circuit protection.

6.11.4 For motors for intermittent service, the characteristics of the arrangements for overload protection are to be chosen in relation to the load factor(s) of the motor(s).

6.11.5 Where fuses are used to protect polyphase motor circuits, means are to be provided to protect the motor from unacceptable overcurrent in the case of single phasing.

6.12 Protection of transformers

6.12.1 Short-circuit protection for transformers is to be provided by circuit-breakers or fuses in the primary circuit and in addition, overload protection is to be provided either in the primary or secondary circuit.

6.12.2 Arrangements are to be made to prevent the primary windings of transformers being inadvertently energised from their secondary side when disconnected from their source supply.

6.13 Harmonic filters

6.13.1 Harmonic filters' final sub-circuits are to be protected individually and individually on each phase against overload and short-circuit. The activation of the protection arrangement in a single phase shall result in automatic disconnection of the complete filter.

6.13.2 A current imbalance detection system is to be installed; it is to be independent from the protection specified in *Pt 6, Ch 2, 6.13 Harmonic filters 6.13.1*.

6.13.3 An alarm is to be initiated in the event of protective device operation or current unbalance that could lead to failure of harmonic filter.

6.13.4 Current imbalance circuits are to be 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated not only on the basis of the system and its associated machinery, but also the complete installation, as well as the ship.

6.13.5 The reconnection of harmonic filters is to require manual intervention.

6.13.6 Individual harmonic filter capacitors are to be provided with a pressure relief valve or overpressure disconnecter to protect against damage from rupture where pressure build-up within hermetically sealed capacitors may occur.

■ *Section 7*

Switchgear and controlgear assemblies

7.1 General requirements

7.1.1 Switchgear and controlgear assemblies and their components are to comply with the following standards, as appropriate for the nominal voltage and, amended where necessary for ambient temperature and other environmental conditions:

- (a) IEC 61439: *Low-voltage switchgear and controlgear assemblies* (relevant parts);
- (b) IEC 62271-200: *High-voltage switchgear and controlgear – Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV*;
- (c) IEC 62271-201: *High-voltage switchgear and controlgear – Part 201: AC insulation-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV*;
- (d) IEC 60092-503: *Electrical installations in ships – Part 503: Special features – AC supply systems with voltages in the range of above 1 kV up to and including 15 kV*;
- (e) IEC 60255: *Measuring relays and protection equipment*; or
- (f) an acceptable and relevant National Standard.

In addition, the requirements of *Pt 6, Ch 2, 7.2 Busbars* to *Pt 6, Ch 2, 7.19 Disconnectors and switch-disconnectors* are to be complied with.

7.2 Busbars

7.2.1 Busbars and their connections are to be of copper or aluminium, all connections being so made as to inhibit corrosion/oxidisation between current-carrying mating faces, which may result in poor electrical contact giving rise to overheating. Busbars and their supports are to be designed to withstand the mechanical stresses which may arise during short-circuits. A test report or calculation to verify the short-circuit withstand strength of the busbar system is to be submitted for consideration when required.

7.2.2 For bare conductors, where no precautions are taken against surface oxidisation, the temperature rise limit at rated normal current is not to exceed 45°C. Where suitable precautions are taken against surface oxidisation, e.g. by using silver, nickel or tin coated terminations, a temperature rise limit not exceeding 60°C is permitted. Where the busbar temperature rises are above 45°C it is to be ensured that there is no adverse effect on equipment adjacent to and/or connected to the busbars and that the

temperature rise limits of any materials in contact with the busbars are not exceeded. A test report or calculation to verify the rated current assigned to the busbar system is to be submitted for consideration when required.

7.3 Circuit-breakers

7.3.1 Circuit-breakers are to comply with one of the following standards amended where necessary for ambient temperature:

- (a) IEC 60947-2: *Low-voltage switchgear and controlgear – Part 2: Circuit-breakers*; or
- (b) IEC 62271-100: *High-voltage switchgear and controlgear – Part 100: Alternating current circuit-breakers*; or
- (c) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a circuit-breaker are to be submitted for consideration when required.

7.3.2 Circuit-breakers are to be capable of isolation.

7.3.3 Circuit-breakers are to be of the trip free type and, where applicable, be fitted with anti-pumping control.

7.3.4 High-voltage circuit-breakers are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

7.3.5 Where the means of setting adjustable protection characteristics are not durably marked and locked in position and cannot be visually inspected (e.g. electronic storage), the settings of characteristics are to be recorded and a copy of the records included in the details retained on board, *see Pt 6, Ch 2, 6.1 General 6.1.4*.

7.3.6 Air circuit-breakers for essential or emergency services and rated at 800 A and above are to have a cumulative count kept of the switching operations of the electrical contacts. This count, along with the manufacturer's details for the circuit-breaker, including the maximum number of switching operations for the electrical contacts, is to be retained on board. These details are to be made available to the Surveyor on request.

7.4 Contactors

7.4.1 High-voltage contactors are to comply with one of the following standards amended where necessary for ambient temperature:

- (a) IEC 62271-106: *High-voltage switchgear and controlgear – Part 106: Alternating current contactors, contactor-based controllers and motor-starters*; or
- (b) an acceptable and relevant National Standard.

Type test reports to verify the characteristics of a contactor are to be submitted for consideration when required.

7.4.2 High-voltage contactors are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

7.5 Creepage and clearance distances

7.5.1 The shortest distances between conductive parts and between conductive parts and earth, in air or along the surface of an insulating material, are to be suitable for the rated voltage having regard to:

- the nature of the insulating material;
- the transient over voltages developed by switching and fault conditions; and
- the environment into which the assembly will be installed.

Each assembly type is to be subjected to an impulse voltage test in accordance with its constructional Standard or, alternatively, the minimum distances for bare conductive parts in switchgear and controlgear assemblies given in *Table 2.7.1 Minimum clearance distances* are to be used.

Table 2.7.1 Minimum clearance distances

Nominal voltage (V)	Minimum clearance distance (mm)		
	Verified assemblies, see Note 2		Non-verified assemblies
	Main switchboards	Other switchgear and controlgear	Main switchboards and other switch and controlgear

≤ 250 (see Note 1)	8	8	15
≤ 690 (see Note 1)	8	8	20
≤ 1000 (see Note 1)	8	8	25
< 3,300	32	26	55
< 6600	60	50	90
< 11,000	100	80	120
≤ 15,000	See Note 3	See Note 3	160
<p>Note 1 For assemblies installed in spaces where the pollution degree is > 3, see Pt 6, Ch 2, 7.5 Creepage and clearance distances 7.5.2.</p> <p>Note 2 For the verification requirements for a verified assembly refer to IEC 61439-2.</p> <p>Note 3 Clearance distances with reference to the applicable relevant National or International Standards, are to be submitted for approval, see Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.4.</p>			

7.5.2 For assemblies with a rated voltage of up to and including 1kV, the requirement of Pt 6, Ch 2, 7.5 Creepage and clearance distances 7.5.1 may be met by complying with IEC 60092-302 *Electrical installations in ships – Part 302: Low-voltage switchgear and controlgear assemblies*.

- Table 2.7.1 Minimum clearance distances and Table 2.7.2 Minimum creepage distances indicate the minimum clearance and creepage distances normally allowed.
- For assemblies installed in spaces where the environmental conditions are in excess of pollution degree 3 (that is conductive pollution occurs or dry, non conductive pollution occurs which is expected to be conductive due to condensation) as defined in IEC 61439-1, *Low-voltage switchgear and controlgear assemblies – Part 1: General requirements*; the clearance distances for non-verified assemblies are to be used.
- A minimum creepage distance of 16 mm is permitted for assemblies verified in accordance with the requirements of IEC 61439-2, *Low-voltage switchgear and controlgear assemblies – Part 2: Power switchgear and controlgear assemblies*.
- An alternative relevant National or International Standard may be used when an acceptable justification is submitted as part of the documentation required by Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.4.

7.5.3 For assemblies with a rated voltage above 1kV, the requirement of Pt 6, Ch 2, 7.5 Creepage and clearance distances 7.5.1 may be met by complying with IEC 60092-503 *Electrical installations in ships – Part 503: Special features – AC supply systems with voltages in the range of above 1 kV up to and including 15 kV*.

- Table 2.7.1 Minimum clearance distances and Table 2.7.2 Minimum creepage distances indicate the minimum clearance and creepage distances normally allowed.
- For main switchboards rated at above 1kV, a minimum clearance distance of 25 mm is required for busbars and other bare conductors.

An alternative relevant National or International Standard may be used when an acceptable justification is submitted as part of the documentation required by Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.4.

Table 2.7.2 Minimum creepage distances

Nominal voltage (V)	Minimum creepage distance (mm)	
	Main switchboards	Other switchgear and controlgear
≤ 250 (see Note 1)	20	20

≤690 (see Note 1)	25	25
≤1000 (see Note 1)	35	35
<3,300	48	See Note 2
<6,600	90	70
<11, 000	150	120
≤15, 000	See Note 2	See Note 2
<p>Note 1 For verified assemblies a minimum creepage distance of 16 mm is permitted for LV switchboards, see <i>Pt 6, Ch 2, 7.5 Creepage and clearance distances 7.5.2</i>.</p> <p>Note 2 Creepage distances, with reference to the applicable relevant National or International Standards, are to be submitted for approval, see <i>Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.3</i>.</p>		

7.5.4 Suitable shrouding or barriers are to be provided in way of connections to equipment, where necessary, to maintain the minimum distances in *Table 2.7.1 Minimum clearance distances*.

7.6 Degree of protection

7.6.1 Low voltage assemblies where the rated voltage between conductors or to earth exceeds 55 V a.c. or 250 V d.c. are to be of the deadfront or enclosed type. High-voltage assemblies are to be of the enclosed type.

7.6.2 Where switchboards or section boards are required to comply with *Pt 6, Ch 2, 5.2 Essential services 5.2.2*, barriers are to be installed to provide protection for the independent sections against contamination due to the products of arcing, which may result in a fault.

7.6.3 Segregation between low-voltage and high-voltage circuits and equipment installed within common assemblies is to be in accordance with IEC 62271-1: *High-voltage switchgear and controlgear – Part 1: Common specifications*.

7.7 Distribution boards

7.7.1 Distribution boards are to be suitably enclosed unless they are installed in a cupboard or compartment to which only authorised persons have access in which case the cupboard may serve as an enclosure, see *Pt 6, Ch 2, 7.16 Position of switchboards 7.16.4*.

7.8 Earthing of high-voltage switchboards

7.8.1 High-voltage switchboards are to be provided with suitable means to earth isolated circuits so that they are discharged and so maintained that they are safe to touch.

7.8.2 Protective shutters associated with withdrawable parts are to be clearly marked to indicate the incoming and outgoing circuits and bus tie connections. The colour coding shall be as follows:

- Incoming (busbar side) – red;
- Outgoing (circuit side) – yellow; and
- Bus ties – red

7.9 Fuses

7.9.1 Fuses are to comply with one of the following Standards amended where necessary for ambient temperature:

- IEC 60269 (all parts): *Low-voltage fuses* ;
- IEC 60282-1: *High-voltage fuses – Part 1: Current-limiting fuses*;
- acceptable and relevant National Standard for enclosed current-limiting fuses.

Type test reports to verify the characteristics of a fuse are to be submitted for consideration when required.

7.10 Handrails or handles

7.10.1 All main and emergency switchboards are to be provided with an insulated handrail or insulated handles suitably fitted on the front of the switchboard. Where access to the rear is required, a horizontal insulated handrail is to be suitably fitted on the rear of the switchboard.

7.11 Instruments for alternating current generators

7.11.1 For alternating current generators not operated in parallel, each generator is to be provided with at least one voltmeter, one frequency meter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase. Generators above 50 kVA are also to be provided with a wattmeter.

7.11.2 For alternating current generators operated in parallel, each generator is to be provided with a wattmeter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase.

7.11.3 For paralleling purposes, two voltmeters, two frequency meters and two synchronising devices, of which one at least is to be a synchroscope or a set of lamps are to be provided. One voltmeter and one frequency meter are to be connected to the busbars, the other voltmeter and frequency meter are to be switched to enable the voltage and frequency of any generator to be measured. Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by two or more generators operating in parallel, the two synchronising devices are to be independent of each other, see also *Pt 6, Ch 2, 2.2 Number and rating of generators and converting equipment 2.2.1*.

7.11.4 The indicators and displays required by *Pt 6, Ch 2, 7.11 Instruments for alternating current generators 7.11.1* to *Pt 6, Ch 2, 7.11 Instruments for alternating current generators 7.11.3* are to be located and arranged such that they may be viewed at a single operating position. Where manual paralleling is provided, it is to be possible to adjust voltage and frequency at this position; generators are to have controls to adjust their voltage and frequency located at the single operating position. Access to voltage adjustment is to be restricted, such that it will generally only be used by authorised personnel to avoid accidental operation.

7.11.5 Where the indications of voltage, frequency, current and power are displayed digitally, the indications are to be separately displayed.

7.12 Instrument scales

7.12.1 The upper limit of the scale of every voltmeter is to be approximately 120 per cent of the nominal voltage of the circuit, and the nominal voltage is to be clearly indicated.

7.12.2 The upper limit of the scale of every ammeter is to be approximately 130 per cent of the normal rating of the circuit in which it is installed. Normal full load is to be clearly indicated.

7.12.3 Kilowatt meters for use with alternating current generators which may be operated in parallel are to be capable of indicating 15 per cent reverse power.

7.12.4 Where the indications provided by the instrumentation required by *Pt 6, Ch 2, 7.11 Instruments for alternating current generators* are displayed digitally, nominal voltage, over voltage, over current and reverse power indications are to be indicated by an appropriate means. The information provided is to be clearly visible and immediately available.

7.12.5 In general, indications provided by instrumentation which are displayed digitally are not to change more frequently than twice per second.

7.13 Labels

7.13.1 The identification of individual circuits and their devices is to be made on labels of durable material. The ratings of fuses and settings of protective devices are also to be indicated. Section and distribution boards are to be marked with the rated voltage.

7.14 Protection

7.14.1 See *Pt 6, Ch 2, 6 System design – Protection*.

7.15 Wiring

7.15.1 Insulated wiring connecting components are to be stranded, flame retardant and manufactured in accordance with a relevant and acceptable National Standard.

7.16 Position of switchboards

7.16.1 An unobstructed space not less than 1 m wide is to be provided in front of switchboards and section boards. When switchboards and section boards contain withdrawable equipment the unobstructed space is to be not less than 0,4 m wide with this equipment in its fully withdrawn position.

7.16.2 Where necessary, the space at the rear of switchboards and section boards is to be ample to permit maintenance and in general not less than 0,6 m except that this may be reduced to 0,5 m in way of stiffeners or frames.

7.16.3 The spaces defined in *Pt 6, Ch 2, 7.16 Position of switchboards 7.16.1* and *Pt 6, Ch 2, 7.16 Position of switchboards 7.16.2* are to have non-slip surfaces. Where access to live parts within switchboards and section boards is normally possible the surface is, in addition, to be electrically insulated.

7.16.4 So far as is practicable, pipes are not to be installed directly above or in front of or behind switchboards, section boards and distribution boards. If such placing is unavoidable, suitable protection is to be provided in these positions, see *Pt 5, Ch 13, 2 Construction and installation*.

7.16.5 For switchgear and controlgear assemblies, for rated voltages above 1 kV, arrangements are to be made to protect personnel in the event of gases or vapours escaping under pressure as the result of arcing due to an internal fault. Where personnel may be in the vicinity of the equipment when it is energised, this may be achieved by an assembly that has been tested in accordance with Annex A of IEC 62271-200:2011: *High-voltage switchgear and controlgear – Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV* and qualified for classification **IAC** (internal arc classification).

7.17 Switchboard auxiliary power supplies

7.17.1 Where the operation of a protective device relies upon a power supply, an alarm is to be provided to indicate failure of the power supply, unless its failure causes automatic tripping of the protected circuit.

7.18 Testing

7.18.1 Tests in accordance with *Pt 6, Ch 2, 7.18 Testing 7.18.2* to *Pt 6, Ch 2, 7.18 Testing 7.18.4* are to be satisfactorily carried out on all assemblies, complete or in sections, at the manufacturer's premises, and a test report issued by the manufacturer, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.2*.

7.18.2 A high voltage test, see *Pt 6, Ch 2, 21 Testing and trials*.

7.18.3 Calibration of protective devices and indicating instruments is to be verified by means of current and/or voltage injection.

7.18.4 Demonstration of the satisfactory operation of protection circuits, control circuits and interlocks by means of simulated functional tests.

7.18.5 For switchgear and controlgear assemblies, for rated voltages above 1 kV, type tests are to be carried out, in accordance with Annex A of IEC 62271-200:2011: *High-voltage switchgear and controlgear – Part 200: AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV* and **IAC** (internal arc classification) assigned, to verify that the assembly will withstand the effects of an internal arc occurring within the enclosure at a prospective fault level equal to, or in excess of, that of the installation.

7.19 Disconnectors and switch-disconnectors

7.19.1 Disconnectors, switch-disconnectors and their components are to comply with one of the following standards, amended where necessary for ambient temperature and other environmental conditions:

- (a) IEC 60947-3: *Low-voltage switchgear and controlgear – Part 3: Switches, disconnectors, switch-disconnectors and fuse-combination units*;
- (b) IEC 62271-102: *High-voltage switchgear and controlgear – Part 102: High-voltage alternating current disconnectors and earthing switches*;
- (c) acceptable and relevant National Standard.

Type test reports to verify the characteristics of a disconnector or switch-disconnector are to be submitted for consideration when required.

■ Section 8**Protection from electric arc hazards within electrical equipment****8.1 General**

8.1.1 An assessment is to be carried out in accordance with *Pt 6, Ch 2, 8.2 Hazard identification and assessment 8.2.1* for all electrical equipment within which an arcing fault could occur, such as:

- harmonic filters;
- motor starter panels;
- semiconductor converters;
- switchboards, section boards and distribution boards; or
- transformers.

8.2 Hazard identification and assessment

8.2.1 An assessment is to be carried out to identify the hazards and their consequences for personnel resulting from electric arcs within the electrical equipment identified in *Pt 6, Ch 2, 8.1 General 8.1.1*. The purpose of the assessment is to demonstrate that the design incorporates adequate measures to reduce the risk of injury to personnel should an arcing fault occur within the electrical equipment, and that this will help to ensure both personnel and ship safety.

Details of the following are to be submitted:

- (a) each task to be performed, e.g. switching, equipment maintenance, instrument observation or cleaning;
- (b) the hazards to personnel that could result from an electric arc occurring during each task, and the hazards to personnel that could result from the electric arc;
- (c) the methods to be used to help to prevent electric arcs; and
- (d) the methods to be used to protect personnel from hazards resulting from electric arcs within electrical equipment.

8.3 Calculations to be submitted

8.3.1 The following calculations are to be conducted and used in the hazard identification and assessment:

- (a) calculations of the maximum current that would flow through an electric arc between each conductor and its adjacent conductor, and between each conductor and the exposed conductive parts of the enclosure, in the case of an arcing fault;
- (b) the maximum incident energy at the intended working distance in the case of an arcing fault; and
- (c) the distance from each conductor at which the incident energy would be 5 Joules (1,2 calories) per centimetre squared in the case of an arcing fault when the enclosure door is open.

These calculations may be made in accordance with a relevant Standard acceptable to LR, for example, IEEE Standard 1584, *IEEE Guide for Performing Arc-Flash Hazard Calculations*.

8.4 Testing and trials

8.4.1 It is to be demonstrated that, where provided, arrangements to detect arcing faults function correctly.

■ Section 9**Rotating machines****9.1 General requirements**

9.1.1 In addition to the requirements of this Section, rotating machines are to comply with the relevant requirements of the following standards, amended where necessary for ambient temperature, see *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*:

- IEC 60034 *Rotating electrical machines* (all parts); and
- IEC 60092: *Electrical installations in ships* (all parts); or

- an alternative International or National Standard acceptable to LR.

9.1.2 The insulation systems of electrical rotating machines used for essential services are to be tested following the principles detailed in IEC 60505, *Evaluation and qualification of electrical insulations systems*, or an equivalent International or National Standard acceptable to LR.

9.1.3 For all the rotating machines a manufacturer's test certificate is to be provided, *see also Pt 6, Ch 2, 1.4 Surveys 1.4.2 to Pt 6, Ch 2, 1.4 Surveys 1.4.4*.

9.1.4 All machines of 100 kW and over, intended for essential services, are to be surveyed by the Surveyor during manufacture and test, *see also Pt 6, Ch 2, 1.4 Surveys 1.4.6*.

9.1.5 Shaft materials for rotating machines for essential services are to comply with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021* (hereinafter referred to as the Rules for Materials) and be manufactured under LR survey for the following applications:

- (a) shaft material for dynamic positioning and electric propulsion motors;
- (b) shaft material for main engine driven generators where the shaft is part of the propulsion shafting; and
- (c) shaft material for machines with power ratings of 250 kW or greater.

Shaft material for machines with power ratings less than 250 kW is to have a manufacturer's certificate as detailed in *Ch 1 General Requirements* of the Rules for Materials.

9.1.6 Where welding is applied to shafts of machines for securing arms or spiders, stress relieving is to be carried out after welding. The finalised assembly is to be visually examined by the Surveyors, crack detection carried out by an appropriate method and the finished welds found sound and free from cracks.

9.1.7 The rotating parts of machines are to be so balanced that when running at any speed in the normal working range the vibration does not exceed the levels of IEC 60034-14: *Rotating electrical machines – Part 14: Mechanical vibration of certain machines with shaft heights 56 mm and higher – Measurement, evaluation and limits of vibration severity*.

9.1.8 The lubrication arrangement for bearings are to be effective under all operating conditions including the maximum ship inclinations defined by *Pt 6, Ch 2, 1.10 Inclination of ship* and there are to be effective means provided to ensure that lubricant does not reach the machine windings or other conductors and insulators.

9.1.9 Means are to be taken to prevent the ill effects of the flow of currents circulating between the shaft and machine bearings or bearings of connected machinery.

9.1.10 Alternating current machines are to be constructed such that, under any operating conditions, they are capable of withstanding the effects of a sudden short-circuit at their terminals without damage.

9.1.11 Propulsion motors, and generators that form part of electrical propulsion systems, are to have at least one embedded temperature detector (ETD) in each phase of the machine winding in locations which may be subjected to the highest temperature. Where there are two coil sides per slot the ETD's are to be located between the insulated coil sides in the slot, *see Pt 6, Ch 2, 16.1 General 16.1.3*.

9.1.12 A high bearing temperature alarm is to be provided for generators of 100 kW and above, and electric propulsion motors, which are supplied with forced lubrication, *see also Pt 6, Ch 2, 16.6 Protection of propulsion system 16.6.12* for second stage high temperature safe shutdown to prevent damage.

9.1.13 A low lubricating oil pressure alarm is to be provided for generators and electric propulsion motors that are supplied with forced lubrication.

9.1.14 A high lubricating oil temperature alarm is to be provided for electric propulsion motors that are supplied with forced lubrication, *see also Pt 6, Ch 2, 16.6 Protection of propulsion system 16.6.12* for second stage high temperature shutdown to prevent damage

9.1.15 For high voltage machines, the stator insulation system is to be of a type that has undergone design qualification testing in accordance with the applicable requirements of the following International Standards, or relevant alternatives acceptable to LR, to demonstrate its suitability for the operating voltage:

- (a) IEC 60034-18-31, *Rotating electrical machines – Part 18-31: Functional evaluation of insulation systems – Test procedures for form-wound windings – Thermal evaluation and classification of insulation systems used in rotating machines*;
- (b) IEC 60034-18-32, *Rotating electrical machines – Part 18-32: Functional evaluation of insulation systems – Test procedures for form-wound windings – Evaluation by electrical endurance*;

- (c) IEC 60034-18-34, *Rotating electrical machines – Part 18-34: Functional evaluation of insulation systems – Test procedures for form-wound windings – Evaluation of thermomechanical endurance of insulation systems*;
- (d) IEC 60034-27-3, *Dielectric dissipation factor measurement on stator winding insulation of rotating electrical machines*.

Test samples are to be representative in terms of the number and size of conductors, coil construction and the combination of materials and manufacturing process.

9.1.16 The reference insulation system, against which the test samples in *Pt 6, Ch 2, 9.1 General requirements 9.1.15* is to be validated, is to have been demonstrated to be suitable for use in the environmental conditions that the finished machine will be exposed to in service. Documented evidence of such suitability is to be available to the LR Surveyor, at the time these tests are conducted.

9.1.17 Sample coils for use in the machines detailed in *Pt 6, Ch 2, 9.1 General requirements 9.1.15* are to be type tested and subsequently routinely tested in accordance with the following International Standards, or relevant alternatives acceptable to LR. The interval between routine tests is to be agreed with LR, and testing is to be witnessed by an LR Surveyor:

- (a) IEC 60034-27-3, *Dielectric dissipation factor measurement on stator winding insulation of rotating electrical machines*; and
- (b) IEC 60034-15: *Rotating electrical machines – Part 15: Impulse voltage withstand levels of form-wound stator coils for rotating a.c. machines*, with power-frequency voltage withstand testing conducted.

Test samples are to be representative in terms of the number and size of conductors, coil construction, and the combination of materials and manufacturing process.

9.1.18 For coils manufactured using global vacuum pressure impregnated systems, the test samples required in *Pt 6, Ch 2, 9.1 General requirements 9.1.15* and *Pt 6, Ch 2, 9.1 General requirements 9.1.17* are to be:

- (a) in their finished, impregnated state;
- (b) manufactured in accordance with documented production quality control processes and procedures.

9.1.19 Converter-fed high voltage machines intended for essential or emergency services are to be designed for the in service operating conditions originating from the converter. These are to include as a minimum, but are not limited to:

- (a) maximum peak voltage and rise times;
- (b) maximum voltage gradient;
- (c) pulse repetition rate;
- (d) voltage reflections; and
- (e) fault conditions.

9.1.20 The insulation system of the high voltage machine referred to in *Pt 6, Ch 2, 9.1 General requirements 9.1.19* is to be type tested and its suitability verified for use with the converter.

9.1.21 The completed stator of high voltage rotating machines to be used for essential services are to be tested for partial discharge in accordance with IEC 60034-27-1, *Rotating electrical machines Part 27-1: Off-line partial discharge measurements on the winding insulation* or an alternative standard acceptable to LR. Copies of the test reports are to be provided to the Surveyor on request.

9.1.22 For high voltage rotating machines to be used for essential services, suitable access is to be provided which will enable visual inspections of the stator and field windings for signs of damage. Boroscopic and/or endoscopic inspection techniques may be used where appropriate. Areas to be capable of inspection are to include, but are not limited to:

- drive and non-drive ends of the machine;
- stator/core: core laminations; stator wedges; stator bars; space blocks; end windings and connection rings; flux shield; instrumentation;
- field/frame: field wedges; retaining ring; coil end turns.

9.1.23 Where the requirements of *Pt 6, Ch 2, 9.1 General requirements 9.1.22* cannot be achieved, a means of connecting partial discharge monitoring equipment is to be installed. The means of connection is to enable OFF-LINE periodic testing in accordance with the recommendations of the rotating machine manufacturer and IEC 60034-27-1, *Rotating electrical machines Part 27-1: Off-line partial discharge measurements on the winding insulation* or an alternative standard acceptable to LR. Alternatively, the requirements of *Pt 6, Ch 2, 9.1 General requirements 9.1.24* may be applied.

9.1.24 Where it is intended to install on-line partial discharge monitoring equipment, the high voltage rotating machine installation is to be provided with a means of connection which will enable the safe connection of the equipment once the rotating

machine is in service. The means of connection is to enable on-line through-life testing in accordance with the recommendations of the rotating machine manufacturer and one of the following standards:

(a) on-line testing:

- PD IEC/TS 60034-27-2, *Rotating electrical machines Part 27-2: On-line partial discharge measurements on the stator winding insulation of rotating electrical machines*;
- DD IEC/TS 61934: *Electrical insulating materials and systems – Electrical measurement of partial discharges (PD) under short rise time and repetitive voltage impulses*; or

(b) an alternative International or National Standard acceptable to LR.

9.1.25 Converter-fed low voltage propulsion machines are to have insulation systems complying with *Pt 6, Ch 2, 9.1 General requirements 9.1.19* where the waveforms are non-sinusoidal or transients exceed 1 kV.

9.1.26 The entity responsible for assembling the alternating current generating set is to install a rating plate marked with at least the following information:

- (a) the generating set manufacturer's name or mark;
- (b) the set serial number;
- (c) the set date of manufacture (month/year);
- (d) the rated power (both in kW and kVA) with one of the power rating prefixes COP, PRP (or, only for emergency generating sets, LTP) as defined in ISO 8528-1 *Reciprocating internal combustion engine driven alternating current generating sets*;
- (e) the rated power factor;
- (f) the set rated frequency (Hz);
- (g) the set rated voltage (V);
- (h) the set rated current (A); and
- (i) the mass (kg).

9.2 Rating

9.2.1 Generators, including their excitation systems, and continuously rated motors are to be suitable for continuous duty at their full rated output at maximum cooling air or water temperature for an unlimited period, without the limits of temperature rise in *Pt 6, Ch 2, 9.3 Temperature rise* being exceeded. Generators are to be capable of an overload power of not less than 10 per cent at their rated power factor for a period of 15 minutes without injurious heating. Other machines are to be rated in accordance with the duty which they have to perform and, when tested under rated load conditions, the temperature rise is not to exceed the values in *Pt 6, Ch 2, 9.3 Temperature rise*.

9.2.2 When a rotating machine is connected to a supply system with harmonic distortion the rating of the machine is to allow for the increased heating effect of the harmonic loading.

9.2.3 The design and construction of smoke extraction fan motors are to be suitable for the ambient temperature and operating time required. Type test reports to verify the performance of the electric motor are to be submitted for consideration.

9.3 Temperature rise

9.3.1 The limits of temperature rise specified in *Table 2.9.1 Limits of temperature rise of machines cooled by air*, are based on the cooling air temperature and cooling water temperature given in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*.

9.3.2 If it is known that the temperature of cooling medium exceeds the values given in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions* the permissible temperature rise is to be reduced by an amount equal to the excess temperature of the cooling medium.

9.3.3 If it is known that the temperature of cooling medium will be permanently less than the values given in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions* the permissible temperature rise may be increased by an amount equal to the difference between the declared temperature and that given in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions* up to a maximum of 15°C.

9.4 Generator control

9.4.1 Each alternating current generator, unless of the self-regulating type, is to be provided with automatic means of voltage regulation; voltage build-up is not to require an external source of power. Provision is to be made to safeguard the distribution system should there be a failure of the voltage regulating system resulting in a high voltage.

9.4.2 The voltage regulation of any alternating current generator with its regulating equipment is to be such that at all loads, from zero to full load at rated power factor, the rated voltage is maintained within $\pm 2,5$ per cent under steady conditions. There is to be provision at the voltage regulator to adjust the generator no load voltage.

9.4.3 Generators, and their excitation systems, when operating at rated speed and voltage on no-load are to be capable of absorbing the suddenly switched, balanced, current demand of the largest motor or load at a power factor not greater than 0,4 with a transient voltage dip which does not exceed 15 per cent of rated voltage. The voltage is to recover to rated voltage within a time not exceeding 1,5 seconds.

Table 2.9.1 Limits of temperature rise of machines cooled by air

Limits of temperature rise of machines cooled by air, °C								
Part of machine			Method of temperature measurement	Insulation class				
				A	E	B	F	H
1.	(a)	a.c. windings of machines having output of 5000 kVA or more	ETD	55	–	75	95	115
			R	50	-	70	90	110
	(b)	a.c. windings of machines having output of less than 5000 kVA	ETD	55	–	80	100	115
			R	50	65	70	95	110
2.	Windings of armatures having commutators		R	50	65	70	95	115
			T	40	55	60	75	95
3.	Field windings of a.c. and d.c. machines having d.c. excitation other than those in item 4		R	50	65	70	95	115
			T	40	55	60	75	95
4.	(a)	Field windings of synchronous machines with cylindrical rotors having d.c. excitation	R	–	–	80	100	125
	(b)	Stationary field windings of d.c. machines having more than one layer	R	50	65	70	95	115
			T	40	55	60	75	95
	(c)	Low resistance field windings of a.c. and d.c. machines and compensating windings of d.c. machines having more than one layer	R, T	50	65	70	90	115
	(d)	Single-layer windings of a.c. and d.c. machines with exposed bare or varnished metal surfaces and single-layer compensating windings of d.c. machines	R, T	55	70	80	100	125
5.	Permanently short-circuited insulated windings		T	50	65	70	90	115
6.	Permanently short-circuited uninsulated windings		T	The temperature rise of these parts shall in no case reach such a value that there is a risk to any insulation or other materials on adjacent parts or to the item itself				
7.	Magnetic cores and other parts not in contact with windings		T					
8.	Magnetic cores and other parts in contact with windings		T	50	65	70	90	110

9. Commutators and slip-rings open and enclosed	T	50	60	70	80	90
---	---	----	----	----	----	----

Note 1. Where water cooled heat exchangers are used in the machine cooling circuit the temperature rises are to be measured with respect to the temperature of the cooling water at the inlet to the heat exchanger and the temperature rises given in this Table shall be increased by 10°C provided the inlet water temperature does not exceed the values given in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*.

Note 2. T = thermometer method
R = resistance method
ETD = embedded temperature detector.

Note 3. Temperature rise measurements are to use the resistance method whenever practicable.

Note 4. The ETD method may only be used when the ETD's are located between coil sides in the slot.

9.4.4 The transient voltage rise at the terminals of a generator is not to exceed 20 per cent of rated voltage when rated kVA at a power factor not greater than 0,8 is thrown off.

9.4.5 Generators and their voltage regulation systems are to be capable of maintaining, without damage, under steady state short-circuit conditions a current of at least three times the full load rated current for a duration of at least two seconds or where precise data is available for the duration of any time delay which may be provided by a tripping device for discrimination purposes.

9.4.6 Generators required to run in parallel are to be stable from no load (kW) up to the total combined full load (kW) of the group, and load sharing is to be such that the load on any generator does not normally differ from its proportionate share of the total load by more than 15 per cent of the rated output (kW) of the largest machine or 25 per cent of the rated output (kW) of the individual machine, whichever is less.

9.4.7 When generators are operated in parallel, the kVA loads of the individual generating sets are not to differ from the proportionate share of the total kVA load by more than 5 per cent of the rated kVA output of the largest machines.

9.5 Overloads

9.5.1 Machines are to withstand on test, without injury, the following occasional overloads:

- Generators.** An excess current of 50 per cent for 30 seconds after attaining the temperature rise corresponding to rated current, the terminal voltage being maintained as near the rated value as possible. The foregoing does not apply to the overload torque capacity of the prime mover.
- Motors.** At rated speed or, in the case of a range of speeds, at the highest and lowest speeds, under gradual increase of torque, the appropriate excess torque given below. Synchronous motors and synchronous induction motors are required to withstand the excess torque without falling out of synchronism and without adjustment of the excitation circuit preset at the value corresponding to rated load:

d.c. motors 50 per cent for 15 seconds;

polyphase a.c.

synchronous motors 50 per cent for 15 seconds;

polyphase a.c.

synchronous

induction motors 35 per cent for 15 seconds;

polyphase a.c.

induction motors 60 per cent for 15 seconds.

- Propulsion machines.** The overload tests for propulsion machines will be specially considered for each installation.
- Windlasses.** For the design and testing of windlass electric motors, see *Pt 3, Ch 13, 8 Anchor windlass design and testing*.

9.6 Machine enclosure

9.6.1 Where liquid-cooled heat exchangers are used in the machine cooling circuit there is to be provision to detect leakage of the liquid, and the system is to be arranged so as to prevent the entry of liquid into the machine.

9.7 Direct current machines

9.7.1 The final running position of brushgear is to be clearly and permanently marked.

9.7.2 Direct current machines are to work with fixed brush setting from no load to the momentary overload specified without injurious sparking.

9.8 Survey and testing

9.8.1 On machines for essential services tests are to be carried out and a certificate furnished by the manufacturer. The tests are to include temperature rise, momentary overload, high voltage, and commutation. The insulation resistance and the temperature at which it was measured are to be recorded, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.2* to *Pt 6, Ch 2, 1.4 Surveys 1.4.4*

9.8.2 In the case of duplicate machines, type tests of temperature rise, excess current and torque and commutation taken on a machine identical in rating and in all other essential details may be accepted in conjunction with abbreviated tests on each machine. Type tests for propulsion machines will be specially considered, see also *Pt 6, Ch 2, 16 Electric propulsion*. For the abbreviated tests, each machine is to be run and is to be found electrically and mechanically sound and is to have a high voltage test and insulation resistance recorded.

9.8.3 A high voltage test, in accordance with *Pt 6, Ch 2, 21 Testing and trials*, is to be applied to new machines, preferably at the conclusion of the temperature rise test. Where both ends of each phase are brought out to accessible separate terminals each phase is to be tested separately.

9.8.4 Survey during manufacture, see *Pt 6, Ch 2, 1.4 Surveys*, is to be conducted prior to testing of the completed machine and is to include inspection of rotor and stator assemblies to assess compliance with the constructional requirements of the relevant standards and this Section.

9.8.5 For high voltage machines, a description of rotor and stator insulation system application procedures (taping, impregnation, pressing and curing, etc.) with application process records, including details of checks and tests conducted to verify successful application, is to be made available to the LR Surveyor during manufacture, see also *Pt 6, Ch 2, 9.1 General requirements 9.1.15*.

9.8.6 Routine impulse tests are to be carried out on the coils of high voltage machines in accordance with IEC 60034-15: *Rotating electrical machines – Part 15: Impulse voltage withstand levels of form-wound stator coils for rotating a.c. machines*, in order to demonstrate a satisfactory withstand level of the inter-turn insulation to voltage surges. The test is to be carried out on all coils after they have been inserted in the slots and after wedging and bracing. Each coil shall be subjected to at least five impulses of injected voltage, the peak value of the injected voltage being given by the formula:

$$V_{\text{peak}} = 2,45V$$

where

V = rated line voltage r.m.s.

Alternative proposals to demonstrate the withstand level of inter-turn insulation will be considered.

9.8.7 The partial discharge characteristics of high voltage a.c. rotating machines for essential services rated at above 3,6 kV are to be measured and recorded in accordance with *Pt 6, Ch 2, 21.4 On-line partial discharge testing of high voltage rotating machines for essential services*.

■ Section 10

Converter equipment

10.1 Transformers

10.1.1 Paragraphs *Pt 6, Ch 2, 10.1 Transformers 10.1.2* to *Pt 6, Ch 2, 10.1 Transformers 10.1.14* apply to transformers rated for 5 kVA upwards.

10.1.2 Transformers are to comply with the requirements of the following standards:

- (a) IEC 60076 (all parts): *Power transformers* (all parts);

- (b) IEC 60092-503: *Electrical installations in ships – Part 503: Special features – AC supply systems with voltages in the range of above 1 kV up to and including 15 kV*; or
- (c) an acceptable and relevant National Standard amended where necessary for ambient temperature, see *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*.

10.1.3 Transformers may be of the dry type, encapsulated or liquid-filled type.

10.1.4 The temperature rise of the winding of transformers above the ambient temperatures given in *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*, when measured by resistance during continuous operation at the maximum rating, is not to exceed:

- (a) For dry type transformers, air cooled:

insulation of Class A - 50°C

insulation of Class E - 60°C

insulation of Class B - 70°C

insulation of Class F - 90°C

insulation of Class H - 110°C

- (b) For liquid filled transformers:

50°C - where air provides cooling of the fluid

65°C - where water provides cooling of the fluid.

10.1.5 When a transformer is connected to a supply system with harmonic distortion, the rating of the transformer is to allow for the increased heating effect of the harmonic loading. Special attention is to be given to transformers connected for the purpose of reducing harmonic distortion.

10.1.6 The inherent regulation of transformers at their rated output is to be such that the total voltage drop to any point in the installation does not exceed that allowed by *Pt 6, Ch 2, 1.8 Quality of power supplies*.

10.1.7 Transformers, except those for motor starting, are to be double wound.

10.1.8 Liquid fillings for transformers are to be non-toxic and of a type which does not readily support combustion. Liquid filled transformers are to have a pressure relief device with an alarm and there is to be a suitable means provided to contain any liquid which may escape from the transformer due to the operation of the relief device or damage to the tank.

10.1.9 All transformers are to be capable of withstanding for two seconds, without damage, the thermal and mechanical effects of a short-circuit at the terminals of any winding.

10.1.10 When forced cooling is used, whether air or liquid, there is to be monitoring of the cooling medium and transformer winding temperatures with an alarm should these exceed preset limits. There are to be arrangements so that the load may be reduced to a level commensurate with the cooling available.

10.1.11 When oil-immersed transformers are used, there is to be monitoring for low oil level with an alarm when pre-set limits are crossed. There are to be arrangements so that the load may be reduced to a level commensurate with the cooling available.

10.1.12 Transformers for propulsion power are to be provided with arrangements such that, in the event of excessive winding temperature, an alarm is initiated and:

- the load is reduced to a level commensurate with the cooling arrangements; or
- automatic shutdown of the transformer occurs.

10.1.13 Where liquid-cooled heat exchangers are used in transformer cooling circuits, there is to be provision to detect leakage of the liquid, and the system is to be arranged so as to prevent the entry of liquid into the transformer.

10.1.14 The following tests are to be carried out on all transformers at the manufacturer's works, and a certificate of tests issued by the manufacturer, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.2* and *Pt 6, Ch 2, 1.4 Surveys 1.4.3*:

- (a) measurement of winding resistances, voltage ratio, impedance voltage, short-circuit impedance, insulation resistance, load loss, no load loss and current;
- (b) dielectric tests;
- (c) temperature rise test on one transformer of each size and type; and
- (d) where evidence of compliance with *Pt 6, Ch 2, 10.1 Transformers 10.1.9* is not submitted for consideration, short-circuit withstand on one transformer of each size and type.

10.2 Semiconductor converters

10.2.1 The requirements of *Pt 6, Ch 2, 10.2 Semiconductor converters 10.2.2 to Pt 6, Ch 2, 10.2 Semiconductor converters 10.2.18* apply to semiconductor converters rated for 5 kW upwards.

10.2.2 Semiconductor converters are to comply with the requirements of IEC 60146 (all parts): *Semiconductor converters*, or an acceptable and relevant National Standard amended where necessary for ambient temperature, see *Pt 6, Ch 2, 1.9 Ambient reference and operating conditions*.

10.2.3 Semiconductor static power converters are to be rated for the required duty having regard to peak loads, system transients and overvoltage.

10.2.4 Converter equipment may be air or liquid cooled and is to be so arranged that it cannot remain loaded unless effective cooling is maintained. Alternatively the load may be automatically reduced to a level commensurate with the cooling available.

10.2.5 Liquid cooled converter equipment:

- (a) is to be provided with leakage alarms;
- (b) is to be provided with a suitable means to contain any liquid which may leak from the system, preventing the liquid from causing further electrical failures or damage;
- (c) where the semiconductors and other current carrying parts are in direct contact with the cooling liquid, the system is to be provided with:
 - (i) suitable coolant resistivity/ conductivity monitoring;
 - (ii) an alarm at the relevant control station, which is to be initiated if the resistivity/ conductivity values exceed agreed limits; and
- (d) used for main propulsion is to have a shutdown to prevent damage to the converter if the cooling liquid exceeds agreed safe limits of resistivity/ conductivity. See also *Pt 6, Ch 1, 2.6 Bridge control for main propulsion machinery 2.6.8*.

10.2.6 Where forced cooling is used there is to be temperature monitoring of the heated cooling medium with an alarm and shutdown when the temperature exceeds a preset value.

10.2.7 Cooling fluids are to be non-toxic and of low flammability.

10.2.8 Converter equipment is to be so arranged that the semiconductor devices, fuses, control and firing circuit boards may be readily removed from the equipment for repair or replacement.

10.2.9 Test and monitoring facilities are to be provided to permit identification of control circuit faults and faulty components.

10.2.10 Protection devices fitted for converter equipment protection are to ensure that, under fault conditions, the protective action of circuit-breakers, fuses or control systems is such that there is no further damage to the converter or the installation.

10.2.11 Converter equipment, including any associated transformers, reactors, capacitors and filters, if provided, is to be so arranged that the harmonic distortion, and voltage spikes, introduced in to the ships electrical system are within the limits of *Pt 6, Ch 2, 1.8 Quality of power supplies 1.8.3* or restricted to a lower level necessary to ensure that it causes no malfunction of equipment connected to the electrical installation.

10.2.12 Overvoltage spikes or oscillations caused by commutation or other phenomena, are not to result in the supply voltage waveform deviating from a superimposed equivalent sine wave by more than 10 per cent of the maximum value of the equivalent sine wave.

10.2.13 When converter equipment is operated in parallel, load sharing is to be such that under normal operating conditions overloading of any unit does not occur and the combination of paralleled equipment is stable throughout the operating range.

10.2.14 When converter equipment has parallel circuits there is to be provision to ensure that the load is distributed uniformly between the parallel paths.

10.2.15 Transformers, reactors, capacitors and other circuit devices associated with converter equipment, or associated filters, are to be suitable for the distorted voltage and current waveforms to which they may be subjected and filter circuits are to be provided with facilities to ensure that their capacitors are discharged before the circuits are energised.

10.2.16 Any regenerated power developed during the operation of converter equipment is not to result in disturbances to the supply system voltage and frequency which exceeds the limits of *Pt 6, Ch 2, 1.8 Quality of power supplies*.

10.2.17 Where control systems form an integral part of semiconductor equipment, they are to be designed and manufactured with regard to the environmental conditions to which they will be exposed in service and their performance is to be demonstrated during the test and trials programme.

10.2.18 Tests at the manufacturer's works of converter equipment and any associated reactors or filters are to include the high voltage test of *Pt 6, Ch 2, 21.1 Testing* a temperature rise test, on one of each size and type of converter equipment, and such other tests as may be necessary to demonstrate the suitability of the equipment for its intended duty. Details of tests are to be submitted for consideration when required, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.2*.

10.3 Uninterruptible power systems

10.3.1 The requirements of this sub-Section apply to all uninterruptible power systems (UPS) intended to maintain essential services or provide emergency services. This sub-Section is in addition to the requirements of *Pt 6, Ch 2, 10.1 Transformers* to *Pt 6, Ch 2, 10.2 Semiconductor converters* and *Pt 6, Ch 2, 12 Batteries*, as applicable.

10.3.2 UPS units are to be constructed in accordance with IEC 62040: *Uninterruptible power systems (UPS)* (all parts), or an acceptable and relevant National or International Standard.

10.3.3 The operation of a UPS is not to depend upon external services.

10.3.4 The type of UPS unit employed, whether off-line, line-interactive or on-line, is to be appropriate to the power supply requirements of the connected load equipment.

10.3.5 An external bypass, that is hardwired and manually operated, is to be provided for UPS to allow isolation of UPS for safety during maintenance and maintain continuity of load power.

10.3.6 UPS units are to be monitored and an audible and visual alarm is to be initiated in the navigating bridge or the engine control room, or an equivalent attended location for:

- power supply failure (voltage and frequency) to the connected load;
- earth fault;
- operation of battery protective device;
- battery discharge; and
- bypass in operation for on-line UPS units.

10.3.7 UPS units required to provide emergency services are to be suitably located for use in an emergency.

10.3.8 UPS units utilising valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the arrangements comply with *Pt 6, Ch 2, 12.3 Location 12.3.5*. Ventilation arrangements in accordance with IEC 62040-1: *Uninterruptible power systems (UPS) – Part 1: General and safety requirements for UPS*, or an acceptable and relevant National or International Standard, may be considered to satisfy the requirements of *Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.10*.

10.3.9 Output power is to be maintained for the duration required for the connected equipment.

10.3.10 The UPS battery capacity is, at all times, to be capable of supplying the designated loads for the time specified. Where it is proposed that additional circuits are connected to the UPS unit, details verifying that the UPS unit has adequate capacity are to be submitted for consideration, see *Pt 6, Ch 2, 1.5 Additions or alterations*.

10.3.11 On restoration of the input power, the rating of the charge unit is to be sufficient to recharge the batteries while maintaining the output supply to the load equipment.

10.3.12 Tests at the manufacturer's works or after installation on board are to include such tests necessary to demonstrate, to the Surveyor's satisfaction, the suitability of the UPS unit for its intended duty and location. As a minimum the following tests are required:

- a temperature rise test;
- battery capacity test;
- a ventilation rate test of both the equipment housing and the space into which it is to be located, see also *Pt 6, Ch 2, 12.5 Thermal management and ventilation*; and
- functional testing, including operation of alarms.

Details of tests are to be submitted for consideration when required, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.2*.

10.3.13 Where the supply is to be maintained without a break following a power input failure, this is to be verified after installation by practical testing.

10.3.14 UPS units utilising lithium battery systems as energy storage devices are to be in accordance with the following sub-Sections of these Rules as applicable and to the recommendations of the battery manufacturer:

- *Pt 6, Ch 2, 1.2 Documentation required for design review;*
- *Pt 6, Ch 2, 12.1 General;*
- *Pt 6, Ch 2, 12.2 Design and construction;*
- *Pt 6, Ch 2, 12.3 Location;*
- *Pt 6, Ch 2, 12.4 Installation;*
- *Pt 6, Ch 2, 12.5 Thermal management and ventilation and*
- *Pt 6, Ch 2, 21.1 Testing*

■ Section 11

Electric cables, optical fibre cables and busbar trunking systems (busways)

11.1 General

11.1.1 The requirements of *Pt 6, Ch 2, 11.1 General* to *Pt 6, Ch 2, 11.16 Joints and branch circuits in cable systems* apply to all electric and optical fibre cables for fixed wiring unless otherwise exempted. The requirements of *Pt 6, Ch 2, 11.17 Busbar trunking systems (bustrunks)* apply to busbar trunking systems (busways) where they are used in place of electric cables.

11.1.2 Electric cables for fixed wiring are to be designed, manufactured and tested in accordance with the relevant IEC Standard stated in *Table 2.11.1 Electric cables* or an adequate and relevant National Standard.

11.1.3 Details of optical fibre cables for fixed installation are to be submitted to assess compliance with applicable international or National Standards. These are to include:

- Flame retardancy;
- Fire resistance (if applicable);
- Smoke density;
- Halogen content;
- Mechanical properties;

Suitability for use in the marine environment.

11.1.4 Electric cables for electric propulsion systems are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 3* or, alternatively, surveyed by the Surveyors during manufacture and testing to assess compliance with the applicable International or National Standards and application of an acceptable quality management system, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.6*.

11.1.5 Provided that adequate flexibility of the finished cable is assured, conductors of nominal cross-section area 2,5 mm² and less need not be stranded.

11.1.6 Electric and optical fibre cables for non-fixed applications are to comply with a relevant national or international Standard.

11.1.7 For the purpose of this Section, pipes, conduits, trunking or any other system for the additional mechanical protection of cables are hereafter referred to under the generic name 'protective casings'.

11.1.8 Electrical cables for telecommunications and data transfer are, whenever practicable, to be selected in accordance with the recommendations of IEC TR 60092-370: *Guidance on the selection of cables for telecommunication and data transfer including radio-frequency cables*.

Table 2.11.1 Electric cables

Application	IEC Standard	Title
General constructional and testing requirements	60092-350	Electrical installations in ships – Part 350: General construction and test methods of power, control and instrumentation cables for shipboard and offshore applications

Fixed power and control circuits	60092–353	Electrical installations in ships – Part 353: Power cables for rated voltages 1 kV and 3 kV
Fixed power circuits	60092–354	Electrical installations in ships – Part 354: Single- and three-core power cables with extruded solid insulation for rated voltages 6 kV ($U_m = 7,2$ kV) up to 30 kV ($U_m = 36$ kV)
Instrumentation, control and communication circuits up to 60 V	60092–370	Electrical installations in ships – Part 370: Guidance on the selection of cables for telecommunication and data transfer including radio-frequency cables
Control circuits and instrumentation up to 250 V	60092–376	Electrical installations in ships – Part 376: Cables for control and instrumentation circuits 150/250 V (300 V)
Mineral insulated	60702 (all parts)	Mineral insulated cables and their terminations with a rated voltage not exceeding 750 V

11.2 Testing

11.2.1 Routine tests, consisting of at least:

- (a) measurement of electrical resistance of conductors;
- (b) high voltage test, *see also Pt 6, Ch 2, 21 Testing and trials*;
- (c) insulation resistance measurement;
- (d) for high voltage cables, partial discharge tests are to be made in accordance with the requirements of IEC 60885-2: *Electrical test methods for electric cables – Part 2: Partial discharge tests*, or an acceptable and relevant National Standard, at the manufacturer's works prior to despatch; and
- (e) for optical fibres, an attenuation loss (*see Pt 6, Ch 2, 21.6 Optical Fibre Communications Systems*).

Evidence of successful completion of routine tests is to be provided by the manufacturer, *see also Pt 6, Ch 2, 11.1 General 11.1.4*.

11.2.2 Particular, special and type tests are to be made, when required, in accordance with the requirements of the relevant publication or National Standard referred to in *Pt 6, Ch 2, 11.1 General 11.1.2* and a test report issued by the manufacturer.

11.3 Voltage rating

11.3.1 The rated voltage of any electric cable is to be not lower than the nominal voltage of the circuit for which it is used. The maximum sustained voltage of the circuit is not to exceed the maximum voltage for which the cable has been designed.

11.3.2 Electric cables used in unearthed systems are to be suitably rated to withstand the additional stresses imposed on the insulation due to an earth fault.

11.4 Operating temperature

11.4.1 The maximum rated conductor temperature of the insulating material for normal operation is to be at least 10°C higher than the maximum ambient temperature liable to be produced in the space where the cable is installed.

11.4.2 The maximum rated conductor temperatures for normal and short-circuit operation, for the insulating materials included within the standards referred to in *Pt 6, Ch 2, 11.1 General 11.1.2* is not to exceed the values stated in *Table 2.11.2 Maximum rated conductor temperature*.

Table 2.11.2 Maximum rated conductor temperature

Type of insulating compound	Maximum rated conductor temperature, °C		
	Abbreviated designation	Normal operation	Short-circuit
Elastomeric or thermosetting, based upon:			
Ethylene-propylene rubber or similar (EPM or EPDM)	EPR	90	250
High modulus or hard grade ethylene propylene rubber	HEPR	90	250

Cross-linked polyethylene	XLPE	90	250
Cross-linked polyolefin material for halogen-free cables	HF90	90	250
Silicone rubber	S95	95	350

11.4.3 Electric cables constructed of an insulating material not included in *Table 2.11.2 Maximum rated conductor temperature* are to be rated in accordance with the National Standard chosen in compliance with *Pt 6, Ch 2, 11.1 General 11.1.2*.

11.5 Construction

11.5.1 Electric and optical fibre cables are to be at least of a flame-retardant type. IEC 60332-1-2: *Tests on electric and optical fibre cables under fire conditions – Part 1-2: Test for vertical flame propagation for a single insulated wire or cable – Procedure for 1 kW pre-mixed flame*, will be acceptable.

11.5.2 Exemption from the requirements of *Pt 6, Ch 2, 11.5 Construction 11.5.1* for applications such as radio frequency or digital communication systems, which require the use of particular types of cable, will be subject to special consideration.

11.5.3 Where electric and optical fibre cables are required to be of a 'fire resistant type', they are in addition to be easily distinguishable and comply with the performance requirements of the appropriate part of IEC 60331: *Tests for electric cables under fire conditions – Circuit integrity*, when tested with a minimum flame application time of 90 minutes, as follows:

- IEC 60331-1: *Tests for electric cables under fire conditions – Circuit integrity – Part 1: Test method for fire with shock at a temperature of at least 830 degrees C for cables of rated voltage up to and including 0,6/1,0 kV and with an overall diameter exceeding 20 mm*;
- IEC 60331-2: *Tests for electric cables under fire conditions – Circuit integrity – Part 2: Test method for fire with shock at a temperature of at least 830 Degrees C for cables of rated voltage up to and including 0,6/1,0 kV and with an overall diameter not exceeding 20 mm*;
- IEC 60331-21: *Tests for electric cables under fire conditions – Circuit integrity – Part 21: Procedures and requirements – Cables of rated voltage up to and including 0,6/1,0 kV*;
- IEC 60331-23: *Tests for electric cables under fire conditions – Circuit integrity – Part 23: Procedures and requirements – Electric data cables*; or
- IEC 60331-25: *Tests for electric cables under fire conditions – Circuit integrity – Part 25: Procedures and requirements – Optical fibre cables*.

11.5.4 Where electric or optical fibre cables are installed in locations exposed to the weather, in damp and in wet situations, in machinery compartments, refrigerated spaces or exposed to harmful vapours including oil vapour they are to have the conductor insulating materials or optical fibres enclosed in an impervious sheath of material appropriate to the expected ambient conditions.

11.5.5 Where electric or optical fibre cables are installed in locations which are totally submerged for extended periods of time, they are to have the conductor insulating materials or fibres enclosed in an impervious sheath of material appropriate to the expected submerged conditions and duration.

11.5.6 Where it is required that the construction of electric or optical fibre cables includes metallic sheaths, armouring or braids, they are to be provided with an overall impervious sheath or other means to protect the metallic elements against corrosion, see also *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables 11.8.10* and *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables 11.8.11*.

11.5.7 Where cables are installed in an area where contamination by oil is likely to occur, the oversheath is to be of an enhanced oil resistance grade.

11.5.8 Where single core electric cables are used in circuits rated in excess of 20 Amps and are armoured the armour is to be of a non-magnetic material.

11.5.9 Electric cables are to be constructed such that they are capable of withstanding the mechanical and thermal effects of the maximum short-circuit current which can flow in any part of the circuit in which they are installed, taking into consideration not only the time/current characteristics of the circuit protective device but also the peak value of the prospective short-circuit current. Where electric cables are to be used in circuits with a maximum short-circuit current in excess of 70 kA, evidence is to be submitted for consideration when required demonstrating that the cable construction can withstand the effects of the short-circuit current.

11.5.10 All high voltage electric cables are to be readily identified by suitable marking.

11.6 Conductor size

11.6.1 The maximum continuous load carried by a cable is not to exceed its continuous current rating. It is to be chosen such that the maximum rated conductor temperature for normal operation for the insulation is not exceeded. In assessing the current rating the correction factors in *Pt 6, Ch 2, 11.7 Correction factors for cable current rating* may be applied as required.

11.6.2 The cross-sectional area of the conductors is to be sufficient to ensure that, under short-circuit conditions, the maximum rated conductor temperature for short-circuit operation is not exceeded, taking into consideration the time current characteristics of the circuit protective device and the peak value of the prospective short-circuit current.

11.6.3 The cable current ratings given in *Table 2.11.3 Electric cable current ratings, normal operation, based on ambient 45°C* and *Table 2.11.4 Electric cable current ratings, r.m.s. short-circuit current* are based on the maximum rated conductor temperatures given in *Table 2.11.2 Maximum rated conductor temperature*. When cable sizes are selected on the basis of precise evaluation of current rating based upon experimental and calculated data, details are to be submitted for consideration. Alternative short-circuit temperature limits, other than those given in *Table 2.11.4 Electric cable current ratings, r.m.s. short-circuit current*, may be applied using the data provided in:

- IEC 60724: *Short-circuit temperature limits of electric cables with rated voltages of 1kV ($U_m=1,2kV$) and 3kV ($U_m=3,6kV$); or*
- IEC 60986: *Short-circuit temperature limits of electric cables with rated voltages from 6kV ($U_m=7,2kV$) and up to 30kV ($U_m=36kV$).*

Alternative short-circuit temperature limits provided in an acceptable and relevant National Standard may also be considered.

11.6.4 The cross-sectional area of the conductors is to be sufficient to ensure that at no point in the installation will the voltage variations stated in *Pt 6, Ch 2, 1.8 Quality of power supplies* be exceeded when the conductors are carrying the maximum current under their normal conditions of service.

11.6.5 The size of earth conductors is to comply with *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.8*.

Table 2.11.3 Electric cable current ratings, normal operation, based on ambient 45°C

Nominal cross-section (mm ²)	Continuous r.m.s. current rating, in amperes					
	Elastomeric (90°C)			Elastomeric or thermosetting, based on silicon rubber (95°C)

300	42,9	60,7	135,7	51,3	72,6	162,3

11.6.6 The cross-sectional area of conductors used in circuits supplying cyclic or non-continuous loads is to be sufficient to ensure that the cables maximum rated conductor temperature for normal operation is not exceeded when the conductors are operating under their normal conditions of service, see Pt 6, Ch 2, 11.7 Correction factors for cable current rating 11.7.4.

11.7 Correction factors for cable current rating

11.7.1 The correction factors of Pt 6, Ch 2, 11.7 Correction factors for cable current rating 11.7.2 to Pt 6, Ch 2, 11.7 Correction factors for cable current rating 11.7.5 provide a guide for general applications in assessing a current rating. A more precise evaluation based upon experimental and calculated data may be submitted for consideration.

11.7.2 **Bunching of cables.** Where more than six electric cables, which may be expected to operate simultaneously at their full rated capacity, are laid close together in a cable bunch in such a way that there is an absence of free air circulation around them, a correction factor of 0,85 is to be applied. Signal cables may be exempted from this requirement.

11.7.3 **Ambient temperature.** The current ratings of Table 2.11.3 Electric cable current ratings, normal operation, based on ambient 45°C are based on an ambient temperature of 45°C. For other values of ambient temperature the correction factors shown in Pt 6, Ch 2, 11.7 Correction factors for cable current rating 11.7.3 are to be applied.

Table 2.11.5 Correction factors

Insulation material	Correction factor for ambient air temperature of °C										
	35	40	45	50	55	60	65	70	75	80	85
Elastomeric or thermosetting (90°C)	1,10	1,05	1,00	0,94	0,88	0,82	0,74	0,67	0,58	0,47	—
Elastomeric or thermosetting, based on silicone rubber (95°C)	1,10	1,05	1,00	0,95	0,89	0,84	0,77	0,71	0,63	0,55	0,45

11.7.4 **Short time duty.** When the load is not continuous, i.e. operates for periods of half an hour or one hour and the periods of no load are longer than three times the cable's time constant, T in minutes, the cable's continuous rating may be increased by a duty factor, calculated in accordance with:

$$Duty\ factor = \sqrt{\frac{1,12}{1 - e^{-\frac{t_s}{T}}}}$$

When the load is not continuous, is repetitive and has periods of no-load less than three times the cable's time constant, so that the cable has insufficient time to cool down between the applications of load, the cable's continuous rating may be increased by an intermittent factor, calculated in accordance with:

$$Intermittent\ factor = \sqrt{\frac{1 - e^{-\frac{t_p}{T}}}{1 - e^{-\frac{t_s}{T}}}}$$

where

t_p = the intermittent period, in minutes, i.e. the total period of load and no-load before the cycle is repeated

$T = 0,245d^{1,35}$ where d is the overall diameter of the cable, in mm

t_s = the service time of the load current in minutes

11.7.5 **Diversity.** Where cables are used to supply two or more final sub-circuits account may be taken of any diversity factors which may apply, see Pt 6, Ch 2, 5.6 Diversity factor.

11.8 Installation of electric and optical fibre cables

11.8.1 Electric and optical fibre cable runs are to be as far as practicable fixed in straight lines and in accessible positions.

11.8.2 Bends in fixed electric and optical fibre cable runs are to be in accordance with the cable manufacturer's recommendations. The minimum internal radius of bend for the installation of fixed electric cables is to be chosen according to the

construction and size of the cable and is not to be less than the values given in *Table 2.11.6 Minimum internal radii of bends in cables for fixed wiring*.

11.8.3 The manufacturer's tensile load limit of the optical fibre is not to be exceeded during installation.

11.8.4 The manufacturer's minimum bend radii for optical fibres is not to be exceeded during installation.

11.8.5 Pre- and post-installation tests are to be conducted on optical fibre cables as detailed in *Pt 6, Ch 2, 21.6 Optical Fibre Communications Systems*.

11.8.6 The installation of electric and optical fibre cables across expansion joints in any structure is to be avoided. Where this is not practicable, a loop of electric cable of length sufficient to accommodate the expansion of the joint is to be provided. For electric cables, the internal radius of the loop is to be at least 12 times the external diameter of the cable. For optical fibre cables, the internal radius of the loop is to meet the manufacturers' minimum recommendations.

11.8.7 Electric and optical fibre cables for essential and emergency services are to be arranged, so far as is practicable, to avoid galleys, machinery spaces and other enclosed spaces and high fire risk areas except as is necessary for the service being supplied. Such cables are also, so far as reasonably practicable, to be routed clear of bulkheads to preclude their being rendered unserviceable by heating of the bulkheads that may be caused by a fire in an adjacent space.

11.8.8 Electric cables having insulating materials with different maximum rated conductor temperatures are to be so installed that the maximum rated conductor temperature for normal operation of each cable is not exceeded.

11.8.9 Electric and optical fibre cables having a protective covering which may damage the covering of other cables are not to be bunched with those other cables.

Table 2.11.6 Minimum internal radii of bends in cables for fixed wiring

Cable construction		Overall diameter of cable	Minimum internal radius of bend (times overall diameter of cable)
Insulation	Outer covering		
Elastomeric 600/1000 V and below	Metal sheathed Armoured and braided	Any	6D
	Other finishes	≤ 25 mm > 25 mm	4D 6D
Mineral	Hard metal sheathed	Any	6D
Elastomeric above 600/1000 V – single core	Any	Any	12D
– multicore	Any	Any	9D

11.8.10 Cables having an exposed metallic screen, braid or armour are to be installed in such a manner that galvanic corrosion by contact with other metals is prevented. Sufficient measures are also to be taken to prevent damage to exposed galvanised coatings during installation.

11.8.11 Protection is to be provided for cable oversheaths in areas where cables are likely to be exposed to damaging substances under normal circumstances or areas where the spillage or release of harmful substances is likely.

11.8.12 Electric and optical fibre cables are to be as far as practicable installed remote from sources of heat. Where installation of cables near sources of heat cannot be avoided and where there is consequently a risk of damage to the cables by heat, suitable shields, insulation or other precautions are to be installed between the cables and the heat source. The free air circulation around the cables is not to be impaired.

11.8.13 Where electric and optical fibre cables are installed in bunches, provision is to be made to limit the propagation of fire. This requirement is considered satisfied when cables of the bunch have been tested in accordance with the requirements of IEC 60332-3-22: *Tests on electric and optical fibre cables under fire conditions – Part 3-22: Test for vertical flame spread of vertically-mounted bunched wires or cables – Category A*, and are installed in the same configuration(s) as are used for the test(s). If the cables are not so installed, information is to be submitted to demonstrate satisfactorily that suitable measures have been taken to ensure that an equivalent limit of fire propagation will be achieved for the configurations to be used. Particular attention is to be given to cables in:

- airtight or equivalent spaces; and
- vertical runs in trunks and other restricted spaces.

In addition, cables that comply with the requirements of IEC 60332-3-22 are also required to meet the requirements of IEC 60332-1-2: *Tests on electric and optical fibre cables under fire conditions – Part 1-2: Test for vertical flame propagation for a single insulated wire or cable – Procedure for 1 kW pre-mixed flame*.

11.8.14 Electric and optical fibre cables are not to be coated or painted with materials which may adversely affect their sheath or their fire performance.

11.8.15 Where electric and optical fibre cables are installed in refrigerated spaces they are not to be covered with thermal insulation but may be placed directly on the face of the refrigeration chamber, provided that precautions are taken to prevent the electric cables being used as casual means of suspension.

11.8.16 All metal coverings of electric and optical fibre cables are to be earthed in accordance with *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts*.

11.8.17 High voltage cables may be installed as follows:

- in the open, (e.g. on carrier plating), when they are to be provided with a continuous metallic sheath or armour which is effectively bonded to earth to reduce danger to personnel. The metallic sheath or armour may be omitted provided that the cable sheathing material has a longitudinal electric resistance high enough to prevent sheath currents which may be hazardous to personnel;
- contained in earthed metallic protective casings when the cables may be as in *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables* 11.8.17 or the armour or metal sheath may be omitted. In the latter case care is to be taken to ensure that protective casings are electrically continuous and that short lengths of cable are not left unprotected.

11.8.18 High voltage electric cables are not to be run in the open through accommodation spaces.

11.8.19 High-voltage electric cables are to be segregated from electric cables operating at lower voltages.

11.8.20 Electric and optical fibre cables are to be, so far as reasonably practicable, installed remote from sources of mechanical damage. Where necessary the cables are to be protected in accordance with the requirements of *Pt 6, Ch 2, 11.9 Mechanical protection of cables*.

11.8.21 Electric and optical fibre cables with the exception of those for portable appliances and those installed in protective casings are to be fixed securely in accordance with the requirements of *Pt 6, Ch 2, 11.10 Cable support systems*.

11.8.22 Electric and optical fibre cables serving any essential services and any glands through which they pass must be able to withstand flooding for a period of 36 hours, based on the water pressure that may occur at the location.

11.8.23 Where electric and optical fibre cables penetrate bulkheads and decks the requirements of *Pt 6, Ch 2, 11.11 Penetration of bulkheads and decks by cables* are to be complied with.

11.8.24 Where electric and optical fibre cables are installed in protective casings the requirements of *Pt 6, Ch 2, 11.12 Installation of electric and optical fibre cables in protective casings* are to be complied with.

11.8.25 a.c. wiring is to be carried out using multicore cables wherever reasonably practicable. Where it is necessary to install single core electric cables for alternating current circuits in excess of 20 Amps the requirements of *Pt 6, Ch 2, 11.14 Single-core electric cables for alternating current* are to be complied with, see also *Pt 6, Ch 2, 11.5 Construction* 11.5.8.

11.9 Mechanical protection of cables

11.9.1 Electric cables exposed to risk of mechanical damage are to be protected by suitable protective casings unless the protective covering (e.g. armour or sheath) is sufficient to withstand the possible cause of damage.

11.9.2 Electric cables installed in spaces where there is exceptional risk of mechanical damage such as holds, storage spaces, cargo spaces, etc. are to be suitably protected by metallic protective casings, even when armoured, unless the ship's structure affords adequate protection.

11.9.3 Metal protective casings are to be efficiently protected against corrosion, and effectively earthed in accordance with *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts*.

11.10 Cable support systems

11.10.1 Electric cables are to be effectively supported and secured, without being damaged, to the ship's structure, either indirectly by a cable support system, or directly by means of clips, saddles or straps to bulkheads etc. see *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables 11.8.7*.

11.10.2 Cable support systems, which may be in the form of trays or plates, separate support brackets, hangers or ladder racks, together with their fixings and accessories, are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The cable support system is to be effectively secured to the ship's structure, the spacing of the fixings taking account of the probability of vibration and any heavy external forces, e.g. where located in areas subject to impact by sea-water.

11.10.3 The distances between the points at which the cable is supported (e.g. distances between ladder rungs, support brackets, hangers, etc.) are to be chosen according to the construction of cable (i.e. size and rigidity) and the probability of vibration and are to be generally in accordance with those given in *Table 2.11.7 Maximum spacing for supports or fixings for securing cables*.

Table 2.11.7 Maximum spacing for supports or fixings for securing cables

External diameter of cable		Non-armoured cables	Armoured cables
exceeding	not exceeding		
mm	mm	mm	mm
–	8	200	250
8	13	250	300
13	20	300	350
20	30	350	400
30	-	400	450

11.10.4 Where the cables are laid on top of their support system, the spacings of fixings may be increased beyond those given in *Table 2.11.7 Maximum spacing for supports or fixings for securing cables*, but should take account of the probability of movement and vibration and in general is not to exceed 900 mm. This relaxation is not to be applied where cables can be subjected to heavy external forces, e.g. where they are run on, or above, open deck or in areas subject to impact by sea-water.

11.10.5 Single core electric cables are to be firmly fixed, using supports of strength adequate to withstand forces corresponding to the values of the peak prospective short-circuit current.

11.11 Penetration of bulkheads and decks by cables

11.11.1 Where electric and optical fibre cables pass through watertight, fire insulated or gastight bulkheads or decks separating hazardous zones or spaces from non-hazardous zones or spaces, the arrangements are to be such as to ensure the integrity of the bulkhead or deck is not impaired. The arrangements chosen are to ensure that the cables are not adversely affected.

11.11.2 Where cables pass through non-watertight bulkheads or structural steel, the holes are to be bushed with suitable material. If the steel is at least 6 mm thick, adequately rounded edges may be accepted as the equivalent of bushing.

11.11.3 Electric and optical fibre cables passing through decks are to be protected by deck tubes or ducts.

11.11.4 Where cables pass through thermal insulation they are to do so at right angles, in tubes sealed at both ends.

11.11.5 A schedule of watertight cable penetrations is to be prepared by the shipbuilder in either hard copy or digitised media. The schedule is to record for each type of penetration installed the following details:

- the marking or identification system used;
- the manufacturer's installation drawings and manual(s);
- the Type Approval certification;
- the as built condition of the penetration after the final inspection in the shipyard; and
- any inspection, modification, repair, and maintenance activities conducted.

11.12 Installation of electric and optical fibre cables in protective casings

11.12.1 Protective casings are to be mechanically continuous across joints and effectively supported and secured to prevent damage to the electric or optical fibre cables.

11.12.2 Protective casings are to be suitably smooth on the interior and have their ends shaped or bushed in such a manner as not to damage the cables.

11.12.3 The internal radius of bends of protective casings are to be not less than that required for the largest cable installed therein, see *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables 11.8.2*.

11.12.4 The space factor (ratio of the sum of the cross sectional areas corresponding to the external diameters of the cables to the internal cross-sectional area of the protective casings) is not to exceed 0,4.

11.12.5 Where necessary, ventilation openings are to be provided at the highest and lowest points of protective casings to permit air circulation and to prevent accumulation of water.

11.12.6 Expansion joints are to be provided in protective casings where necessary.

11.12.7 Protective casings containing high voltage electric cables are not to contain other electric or optical fibre cables and are to be clearly identified, defining their function and voltage.

11.13 Non-metallic cable support systems, protective casings and fixings

11.13.1 Where it is proposed to use non-metallic cable support systems, protective casings or fixings, the additional requirements of this sub-Section apply. For high voltage installations, metallic protective casings are required where *Pt 6, Ch 2, 11.8 Installation of electric and optical fibre cables 11.8.17.(b)* applies.

11.13.2 Non-metallic cable support systems and protective casings are to be installed in accordance with the manufacturer's recommendations. The support systems and protective casings are to have been tested in accordance with an acceptable test procedure for:

- (a) ambient operating temperatures;
- (b) safe working load;
- (c) impact resistance;
- (d) flame retardancy;
- (e) smoke and toxicity; and
- (f) use in explosive gas atmospheres or in the presence of combustible dusts, electrical conductivity;

with satisfactory results.

11.13.3 Non-metallic cable support systems, protective casings and fixings installed on the open deck are to be protected from degradation caused by exposure to solar radiation.

11.13.4 Where the cable support system, protective casing or fixings are manufactured from a material other than metal, suitable supplementary metallic fixings or straps spaced at regular distances are to be provided such that, in the event of a fire or failure, the cable support system, protective casing and the affixed cables are prevented from falling and causing an injury to personnel and/or an obstruction to any escape route. Alternatively, the cables may be routed away from such areas.

11.13.5 The load on non-metallic cable support systems or protective casings is not to exceed the tested safe working load.

11.13.6 When a cable support system or protective casing is secured by means of clips or straps manufactured from a material other than metal the fixings are to be supplemented by suitable metal clips or straps spaced at regular distances each not exceeding 2 m and, for non-metallic cable support systems or protective casings, that used during safe working load testing.

11.13.7 Non-metallic fixings are to be flame retardant in accordance with the requirements of IEC 60092-101: *Electrical installations in ships – Part 101: Definitions and general requirements*, or an alternative relevant National or International Standard.

11.14 Single-core electric cables for alternating current

11.14.1 When installed in protective casings, electric cables belonging to the same circuit are to be installed in the same casing, unless the casing is of non-magnetic material.

11.14.2 Cable clips are to include electric cables of all phases of a circuit unless the clips are of non-magnetic material.

11.14.3 Single-core cables of the same circuit are to be in contact with one another, as far as possible. In any event the distance between adjacent electric cables is not to be greater than one cable diameter.

11.14.4 If single-core cables of current rating greater than 250 A are installed near a steel bulkhead, the clearance between the cables and the bulkhead is to be at least 50 mm unless the cables belonging to the same a.c. circuit are installed in trefoil formation.

11.14.5 Magnetic material is not to be used between single core cables of a group. Where cables pass through steel plates, all the conductors of the same circuit are to pass through a plate or gland, so made that there is no magnetic material between the cables, and the clearance between the cables and the magnetic material is not to be less than 75 mm, unless the cables belonging to the same a.c. circuit are installed in trefoil formation.

11.14.6 Electric cables are to be installed such that the induced voltages, and any circulating currents, in the sheath or armour are limited to safe values.

11.15 Electric cable ends

11.15.1 Where screw-clamp or spring-clamp type terminations are used in electrical apparatus for external cable connections, see *Pt 6, Ch 2, 1.11 Location and construction 1.11.9*, cable conductors of the solid or stranded type may be inserted directly into the terminals. Where flexible conductors are used, a suitable termination is to be fitted to the cable conductor to prevent 'whiskering' of the strands.

11.15.2 If compression type conductor terminations are used on the cable ends, they are to be of a size to match the conductor and to be made with a compression type tool with the dies selected to suit the termination and conductor sizes and having a ratchet action to ensure completion of the compression action.

11.15.3 Soldered sockets may be used in conjunction with non corrosive fluxes provided that the maximum conductor temperature at the joint, under short-circuit conditions, does not exceed 160°C.

11.15.4 High voltage cables of the radial field type (i.e. having a conducting layer to control the electric field within the insulation) are to have terminations which provide electrical stress control.

11.15.5 Electric cables having hygroscopic insulation (e.g. mineral insulated) are to have their ends sealed against ingress of moisture.

11.15.6 Cable terminations are to be of such a design and dimensions that the maximum current likely to flow through them will not result in degradation of the contacts or damage to insulation as the result of overheating.

11.15.7 The fixing of conductors in terminals at joints and at tappings is to be capable of withstanding the thermal and mechanical effects of short-circuit currents.

11.16 Joints and branch circuits in cable systems

11.16.1 If a joint is necessary it is to be carried out so that all conductors or fibres are adequately secured, insulated and protected from atmospheric action. The flame retardant properties of the cable are to be retained, the continuity of metallic sheath, braid or armour is to be maintained and the current carrying capacity or transmission of data through the cable is not to be impaired.

11.16.2 Tappings (branch circuits) are to be made in suitable boxes of such a design that the conductors and fibres remain suitably insulated, protected from atmospheric action and fitted with terminals or busbars of dimensions appropriate to the current rating.

11.16.3 Tappings and splices of optical fibre cables are to be made in accordance with the manufacturers' recommendations and to be provided with appropriate fittings. In addition they are to be located within suitably designed enclosures to ensure that the protection of the optical fibres is maintained.

11.16.4 Cables of a fire resistant type, see *Pt 6, Ch 2, 11.5 Construction 11.5.3* are to be installed so that they are continuous throughout their length without any joints or tappings.

11.17 Busbar trunking systems (bustrunks)

11.17.1 Where busbar trunking systems are used in place of electric cables, they are to comply with the requirements of *Pt 6, Ch 2, 11.17 Busbar trunking systems (bustrunks) 11.17.2* to *Pt 6, Ch 2, 11.17 Busbar trunking systems (bustrunks) 11.17.6*, in addition to the applicable requirements in *Pt 6, Ch 2, 7 Switchgear and controlgear assemblies*.

11.17.2 The busbar trunking, or enclosure system, is to have a minimum ingress protection of IP54, according to IEC60529: *Degrees of protection provided by enclosures* (IP Code).

11.17.3 The internal and external arrangements of the busbar trunking, or enclosure system, are to ensure that the fire and/or watertight integrity of any structure through which it passes is not impaired.

11.17.4 Where the busbar trunking system is employed for circuits on and below the bulkhead deck, arrangements are to be made to ensure that circuits on other decks are not affected in the event of partial flooding under the normal angles of inclination given in *Pt 6, Ch 2, 1.10 Inclination of ship* for essential electrical equipment.

11.17.5 Supports and accessories are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The support system is to effectively secure the busbar trunking system to the ship's structure.

11.17.6 When accessories are fixed to the busbar system by means of clips or straps manufactured from a material other than metal, the fixings are to be supplemented by suitable metal clips or straps, such that, in the event of a fire or failure, the accessories are prevented from falling and causing injury to personnel and/or an obstruction to any escape route. Alternatively, the busbar system may be routed away from such areas.

■ Section 12 Batteries

12.1 General

12.1.1 The requirements of this Section apply to aqueous and non-aqueous permanently installed secondary batteries of the vented and valve-regulated sealed type such that the following goal and functional requirements are achieved:

- **Goal**

Safe energy storage and dependable supply of power to consumers.

- **Functional requirements**

Reasonably foreseeable hazards external to the battery shall be identified and managed.

Reasonably foreseeable hazards internal within the battery shall be identified and managed.

12.1.2 A vented battery is one in which the cells have a cover provided with an opening through which the products of electrolysis and evaporation are allowed to escape freely from the cells to the atmosphere.

12.1.3 A valve-regulated sealed battery is one in which the cells are closed but have an arrangement (valve) which allows the escape of gas if the internal pressure exceeds a predetermined value. The electrolyte cannot normally be replaced.

12.1.4 The following Sections apply to lead acid, nickel cadmium and lithium cell chemistries. Where other chemistries are to be used, the *ShipRight Procedure Assessment of Risk Based Designs* is to be followed.

12.1.5 Lithium battery systems are to satisfy the requirements of LR's *Type Approval System Test Specification Number 5 (2019)*. Alternative arrangements may be subject to special consideration.

12.1.6 Lithium battery management systems are to satisfy the requirements of LR's *Type Approval System Test Specification Number 1 (2018)*. Alternative arrangements may be subject to special consideration.

12.1.7 Where the lithium battery total system installation is less than 20 kWh then it is to be housed in a gastight steel enclosure with a gastight ventilation duct leading to a safe space on open deck and is to be suitable for withstanding the temperatures and pressures generated in the worst case thermal runaway condition. The battery system is to satisfy the requirements of LR's *Type Approval System Test Specification Number 5 (2019)*, or an equivalent and acceptable National or International Standard, amended where necessary for a battery space ambient temperature of 45°C. Alternative arrangements will be subject to special consideration.

12.1.8 The following Sections apply to lithium battery system installations of a total system capacity of 20 kWh or greater and are in addition to those applicable in other Parts of these Rules:

- *Pt 6, Ch 2, 12.1 General 12.1.9;*
- *Pt 6, Ch 2, 12.2 Design and construction 12.2.2 to Pt 6, Ch 2, 12.2 Design and construction 12.2.6;*
- *Pt 6, Ch 2, 12.3 Location 12.3.12;*
- *Pt 6, Ch 2, 12.4 Installation 12.4.5 to Pt 6, Ch 2, 12.4 Installation 12.4.11;*

- Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.8 and Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.12;
- Pt 6, Ch 2, 21.1 Testing 21.1.6

12.1.9 For lithium battery system installations of nominal voltages exceeding 1500 V d.c. the LR *ShipRight Procedure Assessment of Risk Based Designs* is to be followed.

12.1.10 Additional requirements may be imposed by the National Administration with which the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate. Where any such requirements exist, in the event of a conflict with the requirements herein the requirements of the National Administration will generally take precedence.

12.1.11 Integration of a lithium battery system that satisfies a ship's main power demand into the ship's electrical power system is to be in accordance with Pt 6, Ch 2, 24 Hybrid electrical power systems.

12.2 Design and construction

12.2.1 Batteries are to be constructed so as to prevent spilling of the electrolyte due to motion and to minimise the emission of electrolyte spray.

12.2.2 A Failure Mode and Effects Analysis (FMEA) is to be carried out for the lithium battery system installation and is to consider the effects of failure upon safety and dependability of the lithium battery system installation, taking account of reasonably foreseeable internal and external failures such that the goal and functional requirements of Pt 6, Ch 2, 12.1 General 12.1.1 are achieved and is to include but is not limited to the following:

- overpressure, fire and explosion;
- electrical short circuit due to leakage of cell electrolyte or mechanical impact;
- venting out flammable and toxic gases;
- rupture of the casing of cell, battery module, battery pack or battery system with exposure of internal components; and
- ingress of water into the battery space from cooling system leak, fire suppression system release and/or adjacent areas.

No single failure is to directly result in conditions more arduous than those under which the battery system has been type tested or in the hidden loss of any monitoring and control, alarm or safety function (either automatic or manual) on which the battery system installation depends for its safe operation.

12.2.3 The casing of a lithium cell and/or battery module is to incorporate a pressure relief function(s) that will prevent overpressure, rupture or explosion of the battery module enclosure (see Pt 6, Ch 2, 21 Testing and trials).

12.2.4 The lithium battery management system is to continuously monitor the condition of cells, battery modules or battery packs and to maintain them within their specified safe operating region. As a minimum the alarms and safeguards as indicated in Table 2.12.1 *Lithium battery system: alarms and safeguards* are to be provided:

Table 2.12.1 Lithium battery system: alarms and safeguards

Item	Alarm	Note
Cell voltage*	High	Automatic termination of the cell charge current. See Notes 1 and 5
	Low	Per cell. Automatic prevention of cell discharge. See Notes 2 and 5
Cell temperature*	1st stage high	Per sensor. See Notes 4 and 5
	2nd stage high	Per sensor. Automatic shutdown of battery system. See Notes 4 and 5
	Low	Automatic charge and discharge current limitation. See Notes 3 and 4
Charge current of the battery cells	High	Automatic reduction of charge/discharge current. See Note 3

Communication failure between battery management system and external charge controller system	Failure	Automatic shutdown of battery system See Note 6
Battery management system	Failure	Automatic shutdown of battery system
Temperature sensor	Failure	Automatic shutdown of battery system
Voltage sensor	Failure	Automatic shutdown of battery system
Emergency trip*	Active	Automatic shutdown of battery system See Note 5
Insulation resistance	Low	-
<p>Note 1. Cell voltage is to be maintained below the cell manufacturer specified upper limit charge voltage.</p> <p>Note 2. Cell voltage is to be maintained above the cell manufacturer specified lower limit discharge voltage.</p> <p>Note 3. Cell charge/discharge current is to be controlled within cell manufacturer specified current limits.</p> <p>Note 4. Cell temperature is to be controlled within the cell manufacturer specified temperature limits.</p> <p>Note 5. For lithium batteries used as an emergency source of power, only items marked * are to initiate automatic shutdown.</p> <p>Note 6. For lithium batteries used as an emergency source of power, communication failure is to automatically stop and prevent charging.</p> <p>Note 7. Automatic shutdown of battery system includes termination of battery charging and discharging and disconnection from electrical distribution network.</p>		

12.2.5 A fully independent hard-wired means to disconnect the battery system in an emergency from power distribution is to be provided. This emergency trip is to be located outside of the battery space and situated such that it will remain accessible in the event of an emergency inside the battery space and is to initiate an audible and visual alarm at the relevant control stations to advise duty personnel of the emergency condition.

12.2.6 For lithium battery system installations the following is to be measured and displayed at control stations relevant to the system in which the battery system is installed:

- (a) State of charge (SOC) and state of health (SOH) are to be displayed at relevant control stations and on the navigating bridge.
- (b) System alarms are to be displayed at relevant control stations and at least a common alarm displayed on the navigating bridge.

12.3 Location

12.3.1 Vented batteries connected to a charging device with a power output of more than 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be housed in an adequately ventilated compartment assigned to batteries only, or in an adequately ventilated suitable box on open deck.

12.3.2 Vented batteries connected to a charging device with a power output within the range 0,2 kW to 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be installed in accordance with *Pt 6, Ch 2, 12.3 Location 12.3.1*, or may be installed within a well ventilated machinery or similar space.

12.3.3 Vented batteries connected to a charging device with a power output of less than 0,2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, may be installed in an open position or in a battery box in any suitable space.

12.3.4 Where more than one charging device is installed for any battery or group of batteries in one location, the total power output is to be used to determine the installation requirements of *Pt 6, Ch 2, 12.3 Location 12.3.1*, *Pt 6, Ch 2, 12.3 Location 12.3.2* or *Pt 6, Ch 2, 12.3 Location 12.3.3*.

12.3.5 Valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the ventilation requirements of *Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.11* and the charging requirements of *Pt 6, Ch 2, 12.6 Charging facilities 12.6.4* and *Pt 6, Ch 2, 12.6 Charging facilities 12.6.5* are complied with. Equipment that may produce arcs, sparks or high temperatures in normal operation is not to be in close proximity to battery vent plugs or pressure relief valve outlets.

12.3.6 Where lead-acid and nickel-cadmium batteries are installed in the same compartment precautions are to be taken, such as the provision of screens, to prevent possible contamination of electrolytes.

12.3.7 Where batteries may be exposed to the risk of mechanical damage, or falling objects, they are to be suitably protected.

12.3.8 Batteries installed in crew and passenger cabins, together with their associated corridors, are to be of the hermetically sealed type.

12.3.9 A permanent notice prohibiting smoking and the use of naked lights or equipment capable of creating a source of ignition is to be prominently displayed adjacent to the entrances of all compartments containing batteries.

12.3.10 Only electrical equipment necessary for operational reasons and for the provision of lighting is to be installed in compartments provided in compliance with *Pt 6, Ch 2, 12.3 Location 12.3.1*, the compartment ventilation exhaust ducts and zones within a 1,5 m radius of the ventilation outlet(s). Such electrical equipment is to be certified for group IIC gases and temperature Class T1 in accordance with the applicable parts of IEC 60079: *Explosive atmospheres*, or an acceptable and relevant National Standard.

12.3.11 A permanent notice is to be prominently displayed adjacent to battery installations advising personnel that replacement batteries are to be of an equivalent performance type. For valve-regulated sealed batteries, the notice is to advise of the requirement for replacement batteries to be suitable with respect to products of electrolysis and evaporation being allowed to escape from cells to the atmosphere, *see also Pt 6, Ch 2, 1.5 Additions or alterations 1.5.3*.

12.3.12 The lithium battery space is to be separate from other spaces and compartments, is not to be located forward of the collision bulkhead and is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing the main source of electrical power, associated transforming equipment (if any) or the main switchboard. The boundaries of the lithium battery space are to be part of a vessel structure or enclosures and provided with 'A-60' insulation of the bulkhead unless the space is adjacent to spaces of negligible fire risk such as cofferdams, void spaces or similar, in which case consideration may be given to reducing the insulation to 'A-0'. Penetrations through these boundaries are to be protected to the same fire protection standard. Special consideration will be made for a ship not built of steel or equivalent material. All other safety systems within the lithium battery spaces are to be in accordance with the requirements of this Section or, if not made explicit, at least equivalent to those of a machinery space of Category A.

12.4 Installation

12.4.1 Batteries are to be arranged such that each cell or crate of cells is accessible from the top and at least one side and it is to be ensured that they are suitably secured to move with the ship's motion.

12.4.2 The materials used in the construction of a battery rack or stand are to be resistant to the battery electrolyte or suitably protected by paint or a coating.

12.4.3 Measures are to be taken to minimise the effect of any electrolyte spillage and leakage, for example the use of rubber capping around the top of the cells and the provision of a tray of electrolyte-resistant material below the cells, unless the deck is suitably protected with paint or a coating.

12.4.4 The interiors of all compartments for batteries, including crates, trays, boxes, shelves and other structural parts therein, are to be of an electrolyte-resistant material or suitably protected, for example with paint or a coating.

12.4.5 Battery systems are to be installed in accordance with manufacturer's recommendations taking account of the results of the FMEA study.

12.4.6 The lithium battery space and the crates, trays, boxes, shelves and other structural parts therein are to be designed and constructed such that the structural integrity of the battery space will not be compromised in the event of a lithium fire.

12.4.7 The lithium battery space is to be fitted with suitable fixed detectors in accordance with manufacturer's recommendations and which are capable of providing early identification of a fire or thermal runaway condition. Early identification is to include high cell temperature or detection of electrolyte solvent vapours and a combination of smoke and heat detectors. When activated, the fire detection system is to initiate an alarm to the relevant control stations and on the navigating bridge and is to initiate the automatic isolation of electric systems within the lithium battery space, except as described below, and activate the fixed fire-fighting system.

12.4.8 In the event that a fire or thermal runaway condition is identified, the battery monitoring system is to initiate protective features such as automatic safe isolation of the batteries. Ventilation necessary for extraction of gases, active cooling systems, and thermal/safety monitoring and alarm are to be continued prior to, during and after an overheating or fire event. Failure of the monitoring system is to be alarmed to the ship's safety system and is to result in the battery system automatically reverting to a defined safe state.

12.4.9 An appropriate water-based fixed fire-fighting system in accordance with *SOLAS II-2, Part C, Regulation 10 - Fire fighting 10.4.1.1.3* and the manufacturer's recommendation is to be provided for the lithium battery space. The fixed fire-fighting system is to be suitable for heat removal, boundary cooling and/or extinguishing for the duration that the heat and/or gas release are present. Fixed fire-fighting systems using a medium other than water which provide equivalent heat removal, boundary cooling and/or extinguishing for the duration that the heat and/or gas release is present can be taken into consideration provided that appropriate fire tests have been conducted. In particular, the fire-extinguishing media are to be chosen as appropriate for the specific type and characteristics of fire foreseen.

12.4.10 The fixed fire-fighting control system is to be located outside the battery space, be activated automatically and be capable of manual activation. In addition to the fixed fire-fighting system, the battery space is to be provided with a minimum of two (2) portable and suitable fire-extinguishers located outside the space at or near the entrance(s). The number and position of hydrants are to be such that at least two jets of water not emanating from the same hydrant, each from a single length of hose, can reach any part of the lithium battery space. Such hydrants are to be positioned in close proximity to the lithium battery space. Any part of the fire-fighting system which crosses through the lithium battery space without serving it is to be avoided.

12.4.11 The fire detection and alarm systems are to be in accordance with the recommendations of the battery manufacturer and the following sub-Sections of these Rules:

- *Pt 6, Ch 1, 2.8 Fire detection and fire alarm systems ;*
- *Pt 6, Ch 2, 17.1 Fire detection and fire alarm systems*

12.4.12 The technical description detailed in *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.17.(b)* is to consider the actual battery system installation and its integration into the ship, including but not limited to the following:

- arrangement of battery compartment (location, including fire risk of adjacent spaces/compartments, fire burden from equipment other than batteries, heat sources, etc.);
- temperature control arrangements for the battery space and their contribution to system safety;
- ventilation arrangements to prevent concentrations of gasses within the space in case of uncontrolled thermal runaway;
- hazardous area(s) requirements;
- reasonable gas tightness of ventilation ducting;
- fire integrity of the space;
- the use of fire extinguishing arrangements for cooling in the case of uncontrolled thermal runaway.

The FMEA referenced in *Pt 6, Ch 2, 12.2 Design and construction 12.2.2* should address any additional failure modes identified during the preparation of this technical description.

12.4.13 The lithium battery space is to be provided with two means of escape, at least one independent of any watertight door and leading to a safe position outside the space. One of the escapes is to be suitable for the passage of a stretcher. At each entrance/exit an emergency escape breathing device (EEBD) is to be provided. Where the maximum travel distance to the door within the lithium battery space is less than 5 m, a single means of escape is acceptable. The lithium battery space is not to be considered as part of an escape route (primary or secondary) from any other accommodation, control, service space, machinery space of Category 'A' and high fire risk area such as a garage, paint store, etc.

12.5 Thermal management and ventilation

12.5.1 Battery compartments and boxes are to be ventilated to avoid accumulation of dangerous concentrations of flammable gas.

12.5.2 Where a battery compartment ventilator is required to be fitted with a closing device in accordance with *Pt 3, Ch 12, 2.3 Closing appliances 2.3.9*, a warning notice clearly stating the purpose of the closing device, for example:

'This closing device is to be kept open and only closed in the event of a fire or flooding – Explosive gas atmosphere'

is to be provided at the closing device to mitigate the possibility of inadvertent closing of the ventilator. Furthermore, means to lock the battery compartment ventilators in the open position are to be provided.

12.5.3 Ducted natural ventilation may be employed for battery installations connected to a charging device with a power output of 2 kW or less, provided the exhaust duct can be run directly from the top of the compartment or box to the open air above, with no part of the duct more than 45° from the vertical. A suitable opening is also to be provided below the level of the top of the batteries, so as to ensure a free ventilation air flow. The ventilation duct is to have an area not less than 50 cm² for every 1 m³ of battery compartment or box volume.

12.5.4 Where natural ventilation is impracticable or insufficient, mechanical ventilation is to be provided, with the air inlet located near the floor and the exhaust at the top of the compartment.

12.5.5 Mechanical exhaust ventilation complying with *Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.9* is to be provided for battery installations connected to a charging device with a total maximum power output of more than 2 kW. Also, to minimise the possibility of oxygen enrichment, compartments and spaces containing batteries with boost charging facilities are to be provided with mechanical exhaust ventilation irrespective of the charging device power output.

12.5.6 The ventilation system for battery compartments and boxes, other than boxes located on open deck or in spaces to which *Pt 6, Ch 2, 12.3 Location 12.3.2, Pt 6, Ch 2, 12.3 Location 12.3.3* and *Pt 6, Ch 2, 12.3 Location 12.3.5* refer, is to be separate from other ventilation systems. The exhaust ducting is to be led to a location in the open air, where any gases can be safely diluted, away from possible sources of ignition and openings into spaces where gases may accumulate.

12.5.7 Fan motors associated with exhaust ducts from battery compartments are to be placed external to the ducts and the compartments.

12.5.8 Ventilating fans for battery compartments are to be so constructed and be of material such as to minimise risk of sparking in the event of the impeller touching the casing, and are to be suitable for the potentially hazardous and corrosive gases produced in a thermal runaway condition. Non-metallic impellers are to be of an anti-static material.

12.5.9 Battery boxes are to be provided with sufficient ventilation openings located so as to avoid accumulation of flammable gas whilst preventing the entrance of rain or spray.

12.5.10 The ventilation arrangements for all installations of vented type batteries are to be such that the quantity of air expelled is at least equal to:

$$Q = 110In$$

where

n = number of cells in series

I = maximum current delivered by the charging equipment during gas formation, but not less than 25 per cent of the maximum obtainable charging current in amperes

Q = quantity of air expelled in litres/hr.

12.5.11 The ventilation rate for compartments containing valve-regulated sealed batteries may be reduced to 25 per cent of that given in *Pt 6, Ch 2, 12.5 Thermal management and ventilation 12.5.10*.

12.5.12 Thermal management of the lithium battery space is to be assessed, including the criticality of any cooling systems required to ensure reliable operation and to prevent thermal runaway within the marine environment. See also *Pt 6, Ch 1, 1.4 Control, alarm and safety equipment 1.4.3*.

12.6 Charging facilities

12.6.1 Charging facilities are to be provided for all secondary batteries such that they may be completely charged from the completely discharged state in a reasonable time having regard to the service requirements.

12.6.2 Suitable means including an ammeter and a voltmeter, are to be provided for controlling and monitoring charging of batteries, and to protect them against discharge into the charging circuits.

12.6.3 For floating circuits or any other conditions where the load is connected to the battery whilst it is on charge, the maximum battery voltage is not to exceed the safe value for any connected apparatus.

12.6.4 Where valve-regulated sealed batteries are installed, the charging facilities are to incorporate independent means such as overvoltage protection to prevent gas evolution in excess of the manufacturer's design quantity.

12.6.5 Boost charge facilities, where provided, are to be arranged such that they are automatically disconnected should the battery compartment ventilation system fail.

12.7 Recording of batteries for emergency and essential services

12.7.1 A schedule of batteries fitted for use for essential and emergency services is to be compiled and maintained.

12.7.2 Procedures are to be put in place and documented to ensure that, where batteries are replaced, they are of an equivalent performance type, see also *Pt 6, Ch 2, 1.5 Additions or alterations 1.5.3*.

12.7.3 When additions or alterations are proposed to the existing batteries for essential and emergency services, the schedule and replacement procedure documentation are to be updated to reflect the proposed installation and submitted in accordance with *Pt 6, Ch 2, 1.5 Additions or alterations 1.5.2*.

12.7.4 The schedule and replacement procedure documentation are to be made available to the LR Surveyor on request.

■ **Section 13** **Equipment - Heating, lighting and accessories**

13.1 Heating and cooking equipment

13.1.1 The construction of heaters is to give a degree of protection according to IEC 60529: *Degrees of protection provided by enclosures (IP Code)*, or an acceptable and relevant National Standard, suitable for the intended location.

13.1.2 Heating elements are to be suitably guarded.

13.1.3 Heating and cooking equipment is to be installed such that adjacent bulkheads and decks are not subjected to excessive heating.

13.2 Lighting - General

13.2.1 Lampholders are to be constructed of flame retarding non-hygroscopic materials.

13.2.2 Lighting fittings are to be so arranged as to prevent temperature rises which overheat or damage surrounding materials. They must not impair the integrity of fire divisions.

13.3 Incandescent lighting

13.3.1 Tungsten filament lamps and lampholders are to be in accordance with *Table 2.13.1 Lamps and lampholders*.

Table 2.13.1 Lamps and lampholders

Designation	Maximum lamp rating		Maximum lampholder current, A
	Voltage, V	Power, W	
Screw cap lamps			
E40	250	3000	16
E27	250	200	4
E14	250	15	2
E10	24	-	2
Bayonet cap lamps			
B22	250	200	4
B15d	250	15	2
B15s	55	15	2
Tubular fluorescent lamps			
G13	250	115	-
G5	250	80	-
Note Other lamp types are to be in accordance with IEC 60092-306: <i>Electrical installations in ships - Part 306: Equipment - Luminaires and lighting accessories</i> .			

13.3.2 Lampholders of type E40 are to be provided with a means of locking the lamp in the lampholder.

13.4 Fluorescent lighting

13.4.1 Fluorescent lamps and lampholders are to be in accordance with *Table 2.13.1 Lamps and lampholders*.

13.4.2 Fittings, reactors, capacitors and other auxiliaries are not to be mounted on surfaces which are subject to high temperatures. If mounted separately they are additionally to be enclosed in an earthed conductive casing.

13.4.3 Where capacitors of 0,5 microfarads and above are installed, means are to be provided to promptly discharge the capacitors on disconnection of the supply.

13.5 Discharge lighting

13.5.1 Discharge lamps operating in excess of 250 V are only acceptable as fixed fittings. Warning notices calling attention to the voltage are to be permanently displayed at points of access to the lamps and where otherwise necessary.

13.6 Socket outlets and plugs

13.6.1 The temperature rise on the live parts of socket outlet and plugs is not to exceed 30°C. Socket outlets and plugs are to be so constructed that they cannot be readily short-circuited whether the plug is in or out, and so that a pin of the plug cannot be made to earth either pole of the socket outlet.

13.6.2 All socket outlets of current rating in excess of 16 A are to be provided with a switch, and be interlocked such that the plug cannot be inserted or withdrawn when the switch is in the 'on' position.

13.6.3 Where it is necessary to earth the non-current carrying parts of portable or transportable equipment, an effective means of earthing is to be provided at the socket outlet.

13.6.4 On weather decks, galleys, laundries, machinery spaces and all wet situations socket outlets and plugs are to be effectively shielded against rain and spray and are to be provided with means of maintaining this quality after removal of the plug.

13.7 Enclosures

13.7.1 Enclosures for the containing and mounting of electrical accessories are to be of metal, effectively protected against corrosion, or of flame retardant insulating materials.

■ *Section 14*

Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts

14.1 General

14.1.1 The installation of electrical equipment in spaces and locations in which flammable mixtures are liable to collect, e.g. areas containing flammable gas or vapour and/or combustible dust, is to be minimised.

14.1.2 In order to eliminate potential sources of ignition from spaces and locations in which flammable mixtures are liable to collect such hazardous areas are to be identified and electrical equipment within these areas is to be selected and installed in accordance with the requirements of this Section.

14.1.3 Spaces and locations are considered as hazardous in the presence of any of the following:

- (a) spaces or tanks containing either:
 - (i) flammable liquid having a flashpoint (closed-cup test) not exceeding 60°C and below;
 - (ii) flammable liquid having a flashpoint exceeding 60°C, heated or raised by ambient conditions to a temperature within 15°C of its flashpoint; or
 - (iii) flammable gas;
- (b) piping systems or equipment containing fluid defined by (a) and having flanged joints or glands or other openings through which leakage of fluid may occur under normal operating conditions;
- (c) spaces containing coal, grain or other solids liable to release flammable gas and/or combustible dust;

- (d) spaces containing dangerous goods in packaged form, of the following Classes as defined in the IMDG Code: 1 (with the exception of goods in division 1.4, compatibility group S), 2.1 (inclusive of applicable gas bottles for onboard use), 3 (FP<23°C), 6.1 (FP<23°C) and 8 (FP<23°C);
- (e) piping systems or equipment associated with processes (such as electro-chlorination) generating flammable gas as a by-product and having openings from which the gas may escape under normal operating conditions; or
- (f) piping systems or equivalent containing flammable liquids not defined by (a), having flanged joints, glands or other openings through which leakage of fluid in the form of a mist or fine spray may occur under normal operating conditions.

Note FP means flashpoint (closed-cup test).

14.1.4 Equipment that is to be installed in an area where explosive gases can be present is to be selected in accordance with both *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres* and *Pt 6, Ch 2, 14.4 Selection of equipment for use in the presence of combustible dusts*.

14.1.5 Equipment that is to be installed in an area where combustible dusts can be present is to be selected in accordance with *Pt 6, Ch 2, 14.4 Selection of equipment for use in the presence of combustible dusts*.

14.1.6 For permanent secondary battery installations, see *Pt 6, Ch 2, 12 Batteries*.

14.2 Hazardous areas

14.2.1 Hazardous areas and sources of hazard for ships intended for the carriage in bulk of oil cargoes, liquefied gases, other flammable liquid cargoes, the special requirements for ships with spaces for carrying vehicles with fuel in their tanks for their own propulsion, the special requirements for ships intended for the carriage of dangerous goods and materials hazardous only in bulk and the requirements for ships with spaces for storing paint, are defined (either directly, or by reference to other documents) in *Pt 6, Ch 2, 14.10 Requirements for tankers intended for the carriage in bulk* to *Pt 6, Ch 2, 14.15 Requirements for ships with spaces for storing paint*.

14.2.2 Hazardous areas associated with flammable liquids or gases are classified into zones based upon the frequency of the occurrence and duration of an explosive gas atmosphere, as follows:

- **zone 0:** an area in which an explosive atmosphere is present continuously or for long periods or frequently
- **zone 1:** an area in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is likely to occur in normal operation occasionally
- **zone 2:** an area in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if it does occur, will persist for a short period only.

See IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*.

14.2.3 Hazardous areas associated with solid substances or packaged liquids to which *Pt 6, Ch 2, 14.14 Special requirements for ships intended for the carriage of dangerous goods and materials hazardous only in bulk* applies are classified into zones based upon the frequency of the occurrence and duration of an explosive atmosphere due to the presence of gas and/or combustible dust, as follows:

- **hazardous area:** area in which an explosive atmosphere is likely to occur in normal operation (comparable with **zone 1**)
- **extended hazardous area:** area in which an explosive atmosphere is not likely to occur in normal operation and, if it does occur, is likely to do so only infrequently and will exist for a short period only (comparable with **zone 2**).

See IEC 60092-506: *Electrical Installation in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*. An explosive atmosphere may exist due to gas and/or combustible dust.

14.2.4 The following areas are regarded as hazardous, **zone 0**:

- (a) the interiors of those spaces, tanks, piping systems and equipment defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(a)* and *Pt 6, Ch 2, 14.1 General 14.1.3.(b)*; and
- (b) enclosed, unventilated spaces containing pipework or equipment defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(b)* and *Pt 6, Ch 2, 14.1 General 14.1.3.(e)*.

14.2.5 The following areas are regarded as hazardous, **zone 1**:

- (a) unventilated spaces separated by a single bulkhead or deck from a cargo defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(a)*;
- (b) ventilated spaces containing pipework or equipment defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(b)* and *Pt 6, Ch 2, 14.1 General 14.1.3.(e)*;

- (c) zones within a 3 m radius of ventilation outlets, hatches or doorways or other openings into spaces defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(a)* or *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(b)*, vapour having a density relative to that of air of more than 0,75, the hazardous zone is considered to extend.
- (d) zones on open deck within 3 m of the ventilation outlets of cargo tanks defined in *Pt 6, Ch 2, 14.1 General 14.1.3.(a)*, which permit the flow of small volumes of vapour or gas mixtures caused by thermal variation;
- (e) zones within a 3 m radius of flanged joints, or glands or other openings defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(b)*;
- (f) zones within a 1,5 m radius of flanged joints, or glands or other openings defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(e)* and *Pt 6, Ch 2, 14.1 General 14.1.3.(f)*;
- (g) zones within a 3 m radius of bunds or barriers intended to contain spillage of liquids defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(a)*;
- (h) zones on open deck within a 1,5 m radius of any opening into a space defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(a)*;
- (i) enclosed or semi-enclosed spaces with direct opening into a **zone 1** hazardous location.
- (j) interiors of chemical lockers, gas cylinder stores and other such spaces, as defined by *Pt 6, Ch 2, 14.1 General 14.1.3.(d)*, containing dangerous goods for on-board use. This includes, but is not limited to, paints, gas cylinders, chemicals and small quantities of fuel.
- (k) zones within a 1,5 m radius of ventilation inlets or other openings serving spaces defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(b)*; and
- (l) zones on open deck within a vertical cylinder of unlimited height and 6 m radius centred upon the centre of the outlet, and within a hemisphere of 6 m radius below the outlet which permit the flow of large volumes of vapour or gas mixtures during loading/discharging/ballasting

14.2.6 The following areas are regarded as hazardous, **zone 2**:

- (a) ventilated spaces separated by a single bulkhead or deck from a **zone 0** space;
- (b) zones on open deck extending 1,5 m beyond those defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(c)*, *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(e)*, *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(f)*, *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(g)* or *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(h)*;
- (c) zones on open deck extending 2 m beyond those defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(d)*;
- (d) zones on open deck extending 4 m beyond those defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5.(i)*; and
- (e) enclosed or semi-enclosed spaces with direct opening into a **zone 2** hazardous location.

14.2.7 Vertical and horizontal extent of hazardous zones defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.5* and *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.6* is to be considered with reference to density relative to air of flammable gas or vapour encountered. See IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*.

14.2.8 Consideration may also be given to hazardous areas and sources of hazard defined in accordance with IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres* and/or IEC 60079-10-2: *Explosive atmospheres – Part 10-2: Classification of areas – Combustible dust atmospheres*.

14.3 Selection of equipment for use in explosive gas atmospheres

14.3.1 When equipment is to be installed in areas where an explosive gas atmosphere may be present, it is generally to be of a type providing protection against ignition of the gases encountered and compliant with the relevant Parts of IEC 60079: *Explosive atmospheres*, or an acceptable and relevant National Standard, unless permitted otherwise by *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.4*, *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.5* or *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.6*.

14.3.2 The equipment protection type permitted depends on the hazardous area where the equipment is to be located, as defined in *Pt 6, Ch 2, 14.2 Hazardous areas*. For certain locations on the ship other requirements may limit installations to specific equipment types and/or particular applications.

14.3.3 Equipment for **zone 0** or **zone 1**, with the exception of simple apparatus as defined in *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.4* or *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.5*, is to be certified by a National or other appropriate authority. Equipment without independent certification may be considered for installation in **zone 2**.

14.3.4 In **zone 0**, the following may be considered:

- (a) intrinsically safe, category 'a' (Ex 'ia'); or

- (b) simple apparatus (for example thermocouples, photocells, strain gauges, junction boxes, switching devices), included in intrinsically safe circuits of category 'ia', compliant with IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*.

14.3.5 In **zone 1**, the following may be considered:

- (a) equipment permitted within **zone 0**;
- (b) intrinsically safe, category 'b' (Ex 'ib');
- (c) simple apparatus as defined above, included in intrinsically safe circuits of category 'ib';
- (d) increased safety (Ex 'e');
- (e) flameproof (Ex 'd');
- (f) pressurised enclosure (Ex 'p');
- (g) powder filled (Ex 'q'); or
- (h) encapsulated (Ex 'm').

14.3.6 In **zone 2**, the following may be considered:

- (a) equipment permitted within **zone 1**;
- (b) type of protection 'n' or 'N';
- (c) equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2: *Explosive atmospheres – Part 2: Equipment protection by pressurized enclosures "p"*; or
- (d) radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15: *Explosive atmospheres – Part 15: Equipment protection by type of protection "n"*. Additionally, in the case of transmitter aerials, it is to be shown, by detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m, respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment.

14.3.7 Equipment having type of protection 'ia', 'ib', or 'd', is to be of a Group (IIA, IIB or IIC) meeting or exceeding that required for safe operation in the presence of any gas or vapour that can be present, or is to be certified specifically for such gases or vapours.

14.3.8 All equipment is to be of a temperature classification (T1 to T6) that confirms, or is to be assessed so as to confirm, that its maximum surface temperature will not reach the ignition temperature of any gas or vapour, or mixture of gases or vapours, which can be present. The surface temperature considered may be that of an internal or external part, according to the type of protection of the equipment.

14.3.9 Where optical fibre transmission equipment located in a hazardous or non-hazardous area provides energy to, or passes optical energy through, a hazardous area with an explosive gas atmosphere, then:

- (a) The protection type to be appropriate to the zone classification, as detailed in *Table 2.14.1 Zone classification for types of protection associated with optical fibre transmission systems*.
- (b) The optical energy levels in **zone 0** and **1**, including fault conditions, are to be limited to 5 mW/mm² or 35 mW for constant wave and 0,1 mJ/mm² pulsed.
- (c) The optical energy levels in **zone 2**, including fault conditions, are to be limited to 10 mW/mm² or 35 mW for constant wave and 0,5 mJ/mm² pulsed, and
- (d) Pulsed sources with a pulse interval less than 5 seconds, are to be considered constant wave sources.

14.3.10 Consideration may also be given to other types of protection, selected in accordance with the requirements of;

- (a) IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*, or
- (b) Arrangements complying with IEC 60092-502: *Electrical installations in ships – Part 502: Tankers – Special features*, see also Pt 6, Ch 2, 14.10 *Requirements for tankers intended for the carriage in bulk* to Pt 6, Ch 2, 14.12 *Requirements for ships intended for the carriage of other flammable liquid cargoes in bulk*.

Table 2.14.1 Zone classification for types of protection associated with optical fibre transmission systems

Zone	Type of protection level	Associated requirements
0	'op is', Inherently safe optical radiation, 'op sh', Protected fibre optic media with ignition capable beam interlocked with fibre breakage	Safe with two faults additional mechanical protection required
1	'op is', Inherently safe optical, radiation 'op pr', Protected fibre optic media with ignition capable beam 'op sh', Protected fibre optic media with ignition capable beam interlocked with fibre breakage	Safe with single fault additional mechanical protection required additional mechanical protection not necessarily required
2	'op is', inherently safe optical radiation, 'op pr', Protected fibre optic media with ignition capable beam 'op sh', Protected fibre optic media with ignition capable beam interlocked with fibre breakage	Safe in normal operation additional mechanical protection not necessarily required additional mechanical protection not necessarily required

14.4 Selection of equipment for use in the presence of combustible dusts

14.4.1 Where equipment is to be installed in **hazardous areas**, as defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.3*, associated with the presence of combustible dusts, it is, to be of a type certified by a National or other appropriate authority for the combustible dusts and, additionally, any explosive gases encountered.

14.4.2 Where optical fibre transmission equipment located in a **hazardous area**, **extended hazardous area** or non-hazardous area provides energy to, or passes optical energy through, a hazardous area with combustible dusts, then the optical energy levels are to be:

- restricted in **hazardous area** to 5 mW/mm² or 35 mW maximum for constant wave sources or 0,1 mJ/mm² for pulsed sources;
- restricted in **extended hazardous area** to 10 mW/mm² or 35 mW maximum, for constant wave sources or 0,5 mJ/mm² for pulsed sources;
- where a pulsed source has a pulse interval less than 5 seconds, it is to be considered constant wave source.

14.4.4 Electrical equipment for use in **hazardous areas** is to be designed and installed to minimise the accumulation of dust which may interfere with the safe dissipation of heat from the enclosure.

14.4.5 Where equipment is to be installed in **extended hazardous areas**, as defined by *Pt 6, Ch 2, 14.2 Hazardous areas 14.2.3*, associated with the presence of combustible dust and, additionally, any explosive gases encountered, the following may be considered:

- equipment permitted within a **hazardous area** as defined in *Pt 6, Ch 2, 14.4 Selection of equipment for use in the presence of combustible dusts 14.4.1*;
- equipment having degree of protection IP5X, or better, and having a surface temperature under normal operating conditions, but in the absence of a combustible dust layer, not exceeding two-thirds of the minimum ignition temperature in degrees Celsius of the combustible dust/air mixture(s) that can be present and appropriate for any explosive gases encountered; and
- equipment of a type which ensures absence of sparks or arcs and hot spots during normal operation.

14.4.6 Where equipment certified for combustible dusts is not available, consideration will be given to the use of equipment complying as a minimum, with the following requirements provided no explosive gases will be present:

- the enclosure is to be at least dust protected (IP5X) having, when tested in accordance with IEC 60529, an ingress of fine dust within the enclosure not exceeding 10 g per m³ of free air space, and

- (b) the surface temperature of the equipment, under normal operating conditions, but in the absence of a combustible dust layer, is not to exceed two-thirds of the minimum ignition temperature in degrees Celsius of the combustible dust/air mixture(s) that can be present, or
- (c) the equipment is to be certified intrinsically safe "ia" or "ib" having a temperature classification ensuring compliance with *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.5.(b)*, or
- (d) pressurised and operated in accordance with procedures ensuring, prior to its re-energisation, the absence of combustible dust within the enclosure following loss of pressurisation and consequent shutdown, and having surface temperature complying with (b), or
- (e) simple apparatus included in intrinsically safe circuits or radio aerials, complying with *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.5* or *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres 14.3.6* respectively.

14.4.7 Consideration may also be given to other types of protection, selected in accordance with the requirements of:

- (a) IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*; or
- (b) arrangements complying with IEC 60092-506: *Electrical Installation in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*.

14.5 Installation of electrical equipment

14.5.1 The method of installation and application of electrical equipment suitable for use in explosive gas atmospheres or in the presence of combustible dusts is to be in accordance with:

- (a) IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*; or
- (b) the National code of practice relevant to the standard with which the equipment complies.

14.5.2 The ambient temperature range for which the equipment is certified is to be taken to be –20°C to 40°C, unless otherwise stated, and account is to be taken of this when assessing the suitability of the equipment for the auto-ignition temperature of the gases and combustible dusts encountered.

14.5.3 Any special requirements laid down by the equipment certification documentation are also to be observed.

14.5.4 All switches and protective devices from which electrical equipment located in hazardous areas is supplied are to be located in non-hazardous areas. Where it is not practicable to locate the switches and protective devices in non-hazardous area, then the applicable requirements of this section are to be applied to that equipment.

14.5.5 All switches and protective devices from which electrical equipment located in hazardous areas is supplied are to interrupt all poles or phases.

14.5.6 Electrical equipment in hazardous areas, switches and protective devices are to be clearly labelled for identification purposes.

14.6 Semi-enclosed spaces

14.6.1 Semi-enclosed spaces are considered to be spaces limited by decks and/or bulkheads in such a manner that the natural conditions of ventilation are different from those obtained on open deck.

14.7 Ventilation

14.7.1 Natural or mechanical ventilation is to be provided for hazardous enclosed or semi-enclosed areas in order to prevent accumulation of explosive gas atmosphere, leaving no areas of stagnant air. Ventilation rates are to be calculated based on IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*.

14.7.2 Where the rate of ventilation air flow, in relation to the maximum rate of release of flammable substances reasonably to be expected under normal conditions, is sufficient to prevent the concentration of flammable substances approaching their lower explosive limit, consideration may be given to regarding as non-hazardous, the space, ventilation and other openings into it, and the zone around the equipment contained within.

14.7.3 An alarm is to be provided on the navigating bridge, engine control room, and where applicable, cargo control room to indicate any loss of the required ventilation capacity.

14.8 Pressurisation

14.8.1 A space having access to a hazardous area defined as **zone 1** or **zone 2** may be regarded as non-hazardous if all following requirements are met:

- (a) access is by means of an air-lock, having gastight steel doors, the inner of which as a minimum, is self-closing without any hold-back arrangement;
- (b) it is maintained at an overpressure (minimum 0,25 mbar) relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given;
 - (ii) the electrical supply to all equipment not of a type suitable for **zone 1** is automatically disconnected;
 - (iii) where the disconnection of equipment could introduce a hazard, an alarm may be given, in lieu of automatic disconnection, upon loss of overpressure; and
 - (iv) a means of manual disconnection of electrical equipment not of a type suitable for **zone 1**, capable of being controlled from an attended station, is to be provided in conjunction with an agreed operational procedure; and
 - (v) where the means of disconnection, capable of being controlled from an attended station, is located within the space then it is to be of a type suitable for **zone 1**;
- (d) any electrical equipment required to operate upon loss of overpressure, lighting fittings (see *Pt 6, Ch 2, 5.7 Lighting circuits 5.7.3*) and equipment within the air-lock, is to be of a type suitable for **zone 1**; and
- (e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 1**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space.

14.8.2 A space having access to a hazardous area defined as **zone 2** may be regarded as non-hazardous if all following requirements are met:

- (a) access is by means of a self-closing gastight steel door without any hold-back arrangement;
- (b) it is maintained at an overpressure (minimum 0,25 mbar) relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given; and
 - (ii) a means of manual disconnection of electrical equipment not of a type suitable for **zone 2**, capable of being controlled from an attended station, is to be provided; where the means of disconnection, capable of being controlled from an attended station, is located within the space then it is to be of a type suitable for **zone 2**;
- (d) any electrical equipment required to operate upon loss of overpressure (e.g. lighting fittings, see *Pt 6, Ch 2, 5.7 Lighting circuits 5.7.3*), is to be of a type suitable for **zone 2**; and
- (e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 2**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space.

14.9 Cable and cable installation

14.9.1 Electric cables are not, as far as is practicable, to be installed in hazardous areas, except where serving equipment installed within the area. Through runs of cable may be accepted in locations classified as **zone 1** or **zone 2**, where alternative routes are impracticable.

14.9.2 In addition to the requirements of *Pt 6, Ch 2, 11 Electric cables, optical fibre cables and busbar trunking systems (busways)*, cables for circuits that are not intrinsically safe, which are located in hazardous areas, or which may be exposed to cargo oil, oil vapour or gas, are to be either:

- (a) armoured or braided for earth detection, or
- (b) otherwise adequately protected against mechanical or chemical damage, within **zone 2** or non-hazardous locations only, or
- (c) as otherwise specifically permitted elsewhere within this Section, or
- (d) mineral insulated with copper sheath.

14.9.3 Armouring, braiding and other metal coverings of cables installed in hazardous areas are to be effectively earthed at least at both ends.

14.9.4 Where there is risk of intermittent contact between armour and exposed metalwork, non-metallic impervious sheath is to be applied over metallic armour of cables.

14.9.5 Cables associated with intrinsically safe circuits are to be used only for such circuits. They are to be physically separated from cables associated with non-intrinsically safe circuits, e.g. neither installed in the same protective casing nor secured by the same fixing clip. Consideration may be given to other arrangements complying with IEC 60079-14: *Explosive atmospheres– Part 14: Electrical installations design, selection and erection*.

14.9.6 In **zone 0**, cable joints may only be used in intrinsically safe circuits.

14.9.7 Cable runs in **zone 1** or **zone 2** are, where practicable, to be uninterrupted. Where discontinuities cannot be avoided, cable joints are to:

- be made in an enclosure with a type of protection appropriate to the location; or
- provided the joint is not subject to mechanical stress, be epoxy filled, compound-filled or sleeved with heat-shrunk tubing, in accordance with the manufacturer's instructions.

14.10 Requirements for tankers intended for the carriage in bulk

14.10.1 See IEC 60092: *Electrical installations in ships – Part 502: Tankers – Special features*.

14.11 Requirements for ships for the carriage of liquefied gases in bulk

14.11.1 See *Ch 10 Electrical Installations* of the Rules for Ships for Liquefied Gases.

14.12 Requirements for ships intended for the carriage of other flammable liquid cargoes in bulk

14.12.1 See *Electrical Installations* of the Rules for Ships for Liquid Chemicals.

14.13 Special requirements for ships with spaces for carrying vehicles with fuel in their tanks, for their own propulsion

14.13.1 **Passenger ships with special category spaces below the bulkhead deck for carrying vehicles:** electrical equipment fitted within the space and within the exhaust ventilation trunking for the space, is to be of a type acceptable for **zone 1**.

14.13.2 **Passenger ships with special category spaces above the bulkhead deck for carrying vehicles:**

- (a) electrical equipment fitted within a height of 45 cm above the vehicle deck, or any platform on which vehicles are carried, or within the exhaust ventilation trunking for the space, is to be of a type acceptable for **zone 1**;
- (b) electrical equipment situated elsewhere within the space is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP55, see IEC 60529: *Degrees of protection provided by enclosures (IP Code)*. Smoke and gas detector heads are exempt from this requirement.

14.13.3 **Passenger ships with cargo spaces, other than special category spaces, for carrying vehicles and cargo ships with closed ro-ro cargo spaces for carrying vehicles:**

- (a) except where exempted by (b) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a type acceptable for **zone 1**;
- (b) where the ventilation system required by SOLAS - *International Convention for the Safety of Life at Sea as amended, Chapter II-2, Regulation 20 - Protection of vehicle, special category and ro-ro spaces, 20.3.1.1* is arranged to operate continuously and is sufficient to provide at least ten air changes per hour, whenever vehicles are on board, electrical equipment above a height of 45 cm from the vehicle deck, or any platform on which vehicles are carried, is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP 55.

14.13.4 **Vehicle carriers with spaces for carrying vehicles with compressed natural gas in their tanks, for their own propulsion:**

- electrical equipment fitted within the space and within any ventilation trunking for the space, is to be of a type acceptable for **zone 1**. See also Pt 6, Ch 2, 14.3 *Selection of equipment for use in explosive gas atmospheres* 14.3.7.

14.13.5 **Vehicle carriers with spaces for carrying vehicles with compressed hydrogen in their tanks for their own propulsion:**

- electrical equipment fitted within the space and within any ventilation trunking for the space, is to be of a type acceptable for **zone 1**. See also Pt 6, Ch 2, 14.3 *Selection of equipment for use in explosive gas atmospheres* 14.3.7.

14.14 Special requirements for ships intended for the carriage of dangerous goods and materials hazardous only in bulk

14.14.1 Electrical equipment essential for the safety and operation of the ship is to be of a type providing protection against ignition of the gases and/or dusts that can be present, selected in accordance with IEC 60092-506: *Electrical installations in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*.

14.14.2 In addition to the requirements of IEC 60092- 506: *Electrical installations in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*, pipes such as ventilation and bilge pipes, having ends opening into a **hazardous area** are to be considered a **hazardous area**. Enclosed spaces such as pipe tunnels and bilge pump-rooms containing such pipes and with equipment and components such as pumps, valves and flanges are to be considered as **extended hazardous areas** unless protected by overpressure.

14.14.3 Electrical equipment not essential for the safety or operation of the ship and which is not of a type providing protection against ignition of the gases and/or dusts that can be present is to be completely disconnected and protected against unauthorised re-connection. Disconnection is to be made outside the hazardous areas and be effected with isolating links or lockable switches.

14.14.4 Electrical equipment and all cables, including through runs and terminating cables, are to be protected against mechanical damage. Cables are to be either enclosed in screwed heavy gauge steel drawn or seam-welded and galvanised conduit, or protected by electrically continuous metal sheathing or metallic wire armour braid or tape.

14.14.5 Cable penetrations of decks and bulkheads are to be sealed against the passage of gas or vapour.

14.15 Requirements for ships with spaces for storing paint

14.15.1 In order to eliminate potential sources of ignition in paint stores, electrical equipment is to be selected as follows:

- (a) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a type acceptable for **zone 1**;
- (b) electrical equipment situated within 1 m of inlet and exhaust ventilation openings or within 3 m of exhaust mechanical ventilation outlets is to be of a type acceptable for **zone 2**, or is to have an enclosure of ingress protection rating of at least IP55 and maximum surface temperature equivalent to temperature class T3, see IEC 60529, *Classification of Degrees of Protection Provided by Enclosures*. See Pt 6, Ch 2, 1.11 Location and construction 1.11.1 for degrees of protection required for equipment on open deck.

14.15.2 A space having access to a paint store may be regarded as non-hazardous if fulfilling all of the following conditions:

- (a) access is by means of a self-closing gastight steel door without any hold-back arrangement;
- (b) the paint store is ventilated from a non-hazardous area and;
- (c) warning notices are fitted adjacent to the paint store entrance warning of flammable liquids contained in paint store.

Note A watertight door may be considered as being gastight.

14.15.3 The relevant group and temperature class for electrical equipment in hazardous zones are, respectively, IIB and T3.

■ Section 15

Navigation and manoeuvring systems

15.1 Steering gear

15.1.1 The requirements of Pt 6, Ch 2, 15.1 *Steering gear* 15.1.2 to Pt 6, Ch 2, 15.1 *Steering gear* 15.1.5 are to be read in conjunction with those in Pt 5, Ch 19, 4 *Steering control systems* and Pt 5, Ch 19, 5 *Electric power circuits, electric control circuits, monitoring and alarms*.

15.1.2 Two exclusive circuits, fed from the main source of electrical power and each having adequate capacity to supply all the motors which may be connected to it simultaneously are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors. One of these circuits may pass through the emergency switchboard, see also Pt 5, Ch 19, 6 *Emergency power*.

15.1.3 The motor of an associated auxiliary electric or electrohydraulic power unit may be connected to one of the circuits supplying the main steering gear.

15.1.4 Any main and auxiliary steering gear electrical control system and steering gear motors operable from the navigational bridge are to comply with SOLAS Ch II-1, Part C, *Regulation 29 - Steering gear*¹, Section 8 and SOLAS Ch II, Part C, *Regulation 29 - Steering gear*¹ Section 5.

15.1.5 In ships of less than 1600 gross tonnage, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements other than described in *Pt 6, Ch 2, 15.1 Steering gear 15.1.4* for such a motor primarily intended for other services.

15.2 Thruster systems for steering

15.2.1 Where azimuth or rotatable thruster units, used as the sole means of steering, are electrically driven the requirements of *Pt 5, Ch 20, 5.1 General* are to be complied with.

15.3 Thruster systems for dynamic positioning

15.3.1 For ships having a **DP** notation the requirements of *Pt 7, Ch 4 Dynamic Positioning Systems* are to be complied with.

15.4 Thruster systems for manoeuvring

15.4.1 Where a thruster unit is fitted solely for the purpose of manoeuvring, and is electrically driven, its starting and operation is not to cause the loss of any essential services.

15.4.2 In order to ensure that the thruster system is not tripped inadvertently whilst manoeuvring the ship, overload protection in the form of an alarm is to be provided for the electric motor and any associated supply converters, in lieu of tripping.

15.4.3 The thruster unit electric motor is not to be disconnected as part of a load management switching operation.

15.5 Transverse thrust units

15.5.1 Where transverse thrust units are remotely controlled, means are to be provided at the remote control station to stop the propulsion unit.

15.5.2 Transverse thrust units are to be provided with indications of direction and magnitude of thrust and propeller pitch at each station from which it is possible to control justify the propeller pitch.

15.6 Navigation lights

15.6.1 Navigation lights are to be connected separately to a distribution board reserved for this purpose only and accessible to the officer of the watch. This distribution board is to be connected directly or through transformers to the emergency source of electrical power in compliance with, for passenger ships, *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1* or, for cargo ships, *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1*. An alarm is to be activated in the event of failure of a power supply from the distribution board.

15.6.2 Each navigation light is to be controlled and protected in each insulated pole by a switch and fuse or circuit-breaker mounted on the distribution board.

15.6.3 Provision is to be made on the navigating bridge for the navigation lights to be transferred to an alternative circuit fed from the main source of electrical power.

15.6.4 Each navigation light is to be provided with an automatic indicator giving audible and/or visual indication of failure of the light. If an audible device alone is fitted, it is to be connected to an independent source of supply, e.g. a battery, with means provided to test this supply. If a visual signal is used connected in series with the navigation light, means are to be provided to prevent extinction of the navigation light due to failure of the signal. The requirements of this paragraph do not apply to tugs, trawlers and similar small vessels.

15.6.5 For navigation lights using light emitting diodes (consisting of multiple light sources) means to ensure that the overall luminous intensity of the navigation light is sufficient are to be provided in addition to the alarm to indicate the complete loss of the navigation light illumination required by *Pt 6, Ch 2, 15.6 Navigation lights 15.6.4*. For replacement navigation lights, see *Pt 6, Ch 2, 1.5 Additions or alterations 1.5.5*.

15.6.6 To satisfy *Pt 6, Ch 2, 15.6 Navigation lights 15.6.5*, an audible and visual alarm is to be activated to notify the Officer of the Watch when the luminous intensity of the light reduces below the level required by the *IMO Convention on the International Regulations for Preventing Collisions at Sea*. Alternative measures to ensure continuing acceptable performance of navigation lights using light emitting diodes may be considered that are in accordance with:

- IMO Resolution MSC.253(83) - *Adoption of the Performance Standards for Navigation Lights, Navigation Light Controllers and Associated Equipment* - (Adopted on 8 October 2007), and
- EN 14744, *Inland navigation vessels and sea-going vessels – Navigation light*, or a relevant National or International Standard.

Where alternative measures are proposed that require verification by personnel of the luminous intensity of navigation lights using light emitting diodes, details of the inspection implementation in the ship's safety management system and acceptance by the National Administration are to be submitted for consideration.

15.6.7 Navigation light power supply units installed to convert, control and/or monitor the distribution board power supply required by *Pt 6, Ch 2, 15.6 Navigation lights 15.6.1* above for connection to the light source(s) (e.g. for LED type navigation lights) are, in the event of a short-circuit on the unit output, to disconnect or limit the supply to prevent further damage and activate an alarm.

15.6.8 Navigation light power supply units are to be self-checking, detecting failures of the unit itself and activating an alarm. These are to include:

- detection of system lock-ups (program hangs);
- means to detect failure of navigation light switching command input circuits or links; and
- means to detect failure of the navigation light monitoring arrangements required to provide the alarms required by *Pt 6, Ch 2, 15.6 Navigation lights 15.6.4* and *Pt 6, Ch 2, 15.6 Navigation lights 15.6.5*, as applicable.

15.6.9 The navigation light power supply failure alarms required by *Pt 6, Ch 2, 15.6 Navigation lights 15.6.1* are not to be displayed as a group alarm. Other navigation light alarms may be grouped for each navigation light where means are provided for personnel to determine the cause of the alarm. Activation of more than one of the navigation light alarms as a result of a single failure is to be prevented.

15.6.10 Any statutory requirements of the country of registration are to be complied with and may be accepted as an alternative to the above.

15.7 Navigational aids

15.7.1 Navigational aids as required by SOLAS are to be fed from the emergency source of electrical power, see also *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1* and *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1*.

15.7.2 For ships having a notation **NAV1** navigational aids are to have an alternative supply fed from the main source of electrical power, independent of the emergency switchboard, with automatic changeover facilities.

■ **Section 16** **Electric propulsion**

16.1 General

16.1.1 Where the arrangements permit a propulsion motor to be connected to a generating plant having a continuous rating greater than the motor rating, means are to be provided to limit the continuous input to the motor to a value not exceeding the continuous full load torque for which the motor and shafts are approved.

16.1.2 The ventilation and cooling systems for electrical propulsion equipment are to be provided with monitoring devices arranged to operate an alarm if the temperature of the heated cooling medium exceeds a predetermined safe value. See also *Pt 6, Ch 2, 10.2 Semiconductor converters 10.2.5*.

16.1.3 The embedded temperature detectors required by *Pt 6, Ch 2, 9.1 General requirements 9.1.11* are to be arranged to operate an alarm if the temperature exceeds a predetermined safe value.

16.1.4 Propulsion motors, generators and converters are to be provided with means to prevent the accumulation of moisture and condensate when operating at low power levels, or when idle.

16.2 System design and arrangement

16.2.1 In general, for a ship to be assigned an unrestricted service notation, it is to have two independently driven propellers or other propulsion devices, each connected with at least one electric motor, where these form the sole means of propulsion.

16.2.2 For vessels where a propulsion device driven by electric motors is proposed as the sole means of propulsion, at least two effective, independent electric propulsion motors are to be provided and the system is to be designed in accordance with *Pt 7, Ch 14 Requirements for Machinery and Engineering Systems of Unconventional Design*. The risk management is to identify components where a failure could cause loss of propulsion power or other essential services and the proposed arrangements for preventing and mitigating the effects of such a failure.

16.3 Power requirements

16.3.1 The propulsion system is to have sufficient power for manoeuvring the vessel and for going astern. With the ship travelling at its maximum service speed the propulsion equipment is to be capable of stopping and reversing the ship in an agreed time.

16.3.2 The propulsion system is to have adequate torque and power margins for all operating conditions including manoeuvring and rough weather with due regard to propeller and ship characteristics.

16.3.3 The electric power for the propulsion system may be derived from generating sets dedicated to propulsion duty or from a central power generation plant which serves both propulsion and ship service loads.

16.3.4 Where propulsion power is derived from a central, common, power plant the control system is to ensure a safe distribution of power between propulsion and ship services, with tripping of non-essential loads and/or reduction in propulsion power if necessary.

16.3.5 Where a central power generation system is employed the number and rating of generator sets is to be such that with one set out of action the remaining sets are capable of providing all essential and normal ship service loads whilst maintaining an effective level of propulsion power.

16.3.6 Where, in a central power generation system, the electrical power requirements are normally supplied by two or more generating sets operating in parallel, on sudden loss of power from one set, the rating of the remaining set(s) in service is to be sufficient to ensure uninterrupted operation of essential services and an effective level of propulsion power.

16.3.7 Where a central power generation system is employed, means are to be provided to connect available generator sets to meet the power requirement of the electric propulsion system. Arrangements are to be in place to prevent generator sets being automatically disconnected during ship manoeuvres.

16.3.8 Where forced cooling is used on propulsion motors it is to be possible to operate the motor at a defined reduced power level in the event of failure of the forced cooling.

16.3.9 Total harmonic distortion of the a.c. voltage waveform up to 10 per cent on electric propulsion circuits, not directly connected to the main source of electrical power, may be considered where details are submitted which demonstrate that the equipment and systems are capable of operating under such conditions.

16.4 Propulsion control

16.4.1 Propulsion control systems are to be stable throughout their normal operating range and arranged to attenuate any effects of cyclic propeller load fluctuations caused by wave action.

16.4.2 Step-less control of propeller speed, and/or pitch, from zero to full power ahead or astern is to be provided.

16.4.3 The control system is to ensure that there is no dangerous overspeeding of propulsion motors upon loss of load.

16.4.4 Interlocks are to be provided in the control system to ensure that ahead and astern circuits are not energised simultaneously.

16.4.5 Any single fault in either the propulsion machine excitation or power distribution systems is not to result in a total loss of propulsion power.

16.4.6 Control, alarm and safety systems for the propulsion system are to satisfy the requirements of *Pt 6, Ch 1 Control Engineering Systems*.

16.4.7 Each control station is to be provided with an emergency stop function for the propulsion motors. The emergency stop function is to be independent of the normal control system.

16.4.8 The control system is to limit the propulsion power if the power available from the generator(s) is not sufficient to supply the demand level of propulsion power. In the event of a power limitation, there is to be a visual indication at the control stations.

16.4.9 Means are to be provided to identify the cause of propulsion motor power limitation or automatic reduction (e.g. excessive load torque, cooling failure, high temperature, power availability).

16.4.10 Local controls are to be provided, independent of any remote or automatic system, to permit effective control of the propulsion equipment.

16.4.11 Control systems are not to share hardware or data communication links with control, safety and alarm systems not associated with propulsion control, *see also Pt 6, Ch 1, 2.11 Data communication links*.

16.4.12 The factory acceptance test (FAT) of the propulsion control and power management system is to be carried out according to a FAT program acceptable to LR. A reduced FAT program for subsequent vessels in a series is subject to agreement by LR.

16.5 Harmonic filtering for propulsion

16.5.1 The requirements in this Section apply to systems provided with harmonic filters and are in addition to the requirements for harmonic filters in *Pt 6, Ch 2, 5.11 Harmonic filtering* and *Pt 6, Ch 2, 6.13 Harmonic filters*.

16.5.2 In the event of filter circuit failure, continued safe operation of the propulsion system is to be possible by following appropriate procedures, as specified by the manufacturer and/or system integrator. These procedures are to include any operational limitations, and they are to be kept on-board and made available to the Surveyor on request.

16.6 Protection of propulsion system

16.6.1 Provision is to be made for protection against severe overloads, and electrical faults likely to result in damage to plant.

16.6.2 Propulsion motors are to be capable of withstanding, without damage, the thermal and mechanical effects of a short-circuit at the terminals.

16.6.3 Electric motors of podded propulsion units, and/or having permanent magnet excitation, are to be provided with a protective device which, in the event of a short-circuit in the motor or in the cables between the motor and its circuit-breaker, will instantaneously open the circuit-breaker and, in motors with electromagnetic excitation, de-excite the motor. Motors with permanent magnet main excitation are to be provided with means to prevent further damage as a result of continued rotation after disconnection (e.g. shaft brake).

16.6.4 Safeguards for protecting propulsion equipment against damage resulting from earth faults are to be as specified by the equipment manufacturer. Where the fault current flowing is liable to cause damage to the electrical equipment there are to be arrangements for interrupting the current automatically.

16.6.5 For the protection of electrical equipment and cables against overvoltages means are to be provided for limiting the induced voltage when field windings, and other inductive circuits are opened. Protective resistors and devices are to be sized to cater for the likely extreme operating conditions.

16.6.6 An alarm is to be initiated when the excitation system of electric generators providing propulsion power is overloaded such that damage due to heating could occur in the generator or its cabling.

16.6.7 Where, on stopping or reversing the propeller, regenerated energy is produced by the propulsion motor this is not to cause a dangerous increase of speed in the prime mover or a dangerous overvoltage condition on the supply system. Where a central power generation system is used then the voltage and frequency fluctuations are not to exceed the limits given in *Pt 6, Ch 2, 1.8 Quality of power supplies*.

16.6.8 Dynamic braking resistors are to be suitably rated for their expected operation.

16.6.9 Propulsion converters are to be capable of withstanding, without damage, the thermal and mechanical effects of a short-circuit at the terminals or connection to a propulsion motor with a stalled or locked rotor.

16.6.10 Loss of flow of air or liquid cooling of propulsion converters, where used, is to initiate an alarm at an attended control position. Loss of flow of air or liquid cooling is not to result in immediate damage to the propulsion converter, *see Pt 6, Ch 2, 10.2 Semiconductor converters 10.2.4*.

16.6.11 The system integrator is to determine the protection co-ordination required for high voltage propulsion transformers. Where primary protection is to be the only means of protection, then evidence demonstrating that this is sufficient is to be submitted for consideration, *see also Pt 6, Ch 2, 6.12 Protection of transformers 6.12.1*.

16.6.12 Alarms and safeguards for electric propulsion equipment are indicated in *Table 2.16.1 Electric propulsion equipment: Alarms and safeguards*.

Table 2.16.1 Electric propulsion equipment: Alarms and safeguards

Item	Alarm	Note
Electric propulsion equipment ventilation and cooling medium temperature	High	See Pt 6, Ch 2, 16.1 General 16.1.2 and Pt 6, Ch 2, 16.3 Power requirements 16.3.8
Electric propulsion transformer winding temperature	High	See Pt 6, Ch 2, 10.1 Transformers 10.1.12
Electric propulsion generator excitation	Overload	See Pt 6, Ch 2, 16.6 Protection of propulsion system 16.6.6
Electric propulsion generators and motors winding temperature	High	See Pt 6, Ch 2, 16.1 General 16.1.3
Electric propulsion generator and motor bearing temperature	1st stage high 2nd stage high	See Pt 6, Ch 2, 9.1 General requirements 9.1.12 Safe shutdown to prevent damage
Electric propulsion generator and motor lubricating oil supply pressure	Low	See Pt 6, Ch 2, 9.1 General requirements 9.1.13
Electric propulsion generator and motor lubricating oil temperature	1st stage high 2nd stage high	See Pt 6, Ch 2, 9.1 General requirements 9.1.14 Safe shutdown to prevent damage

16.7 Instruments

16.7.1 The main control station is to be provided with the following instruments:

(a) a.c. systems:

- (i) an ammeter for each generator, propulsion motor and propulsion transformer primary; voltmeter, wattmeter and frequency meter for each generator and ammeter for each excitation circuit; and
- (ii) a temperature indicator for each generator, propulsion transformer and propulsion motor windings and bearings, the indicator is to read stator winding temperature of the rotating machines, and cooling system temperature.

(b) d.c. systems:

- (i) a voltmeter and ammeter for each generator and propulsion motor; and
- (ii) an ammeter for each excitation circuit.

16.7.2 Each control station is to be provided with instruments to indicate:

- (a) propeller speed;
- (b) direction of rotation for a fixed pitch propeller or pitch position for a controllable pitch propeller;
- (c) visual indication of power limitation; and
- (d) indication of station in control.

■ Section 17 Fire safety systems

17.1 Fire detection and fire alarm systems

17.1.1 Fire detection and fire alarm systems are to comply with Chapter 9 of the *Fire Safety Systems Code* (FSS Code), SOLAS Chapter II-2, Part C, *Regulation 7 - Detection and alarm* and the requirements in this Section.

17.1.2 In passenger ships, a section of detectors and manually operated call points shall not be situated in more than one main vertical or horizontal zone, except on cabin balconies.

17.2 Automatic Sprinkler, fire detection and fire alarm systems

17.2.1 Automatic sprinkler, fire detection and fire alarm systems are to comply with *Chapter 8 - Automatic Sprinkler, Fire Detection and Fire Alarm Systems* of the FSS Code. See also *Pt 6, Ch 2, 1.16 Operation under fire conditions*.

17.3 Fixed water-based local application fire-fighting systems

17.3.1 Fixed water-based local application fire-fighting systems are to comply with SOLAS, Chapter II-2, Part C, *Regulation 10 - Fire fighting*, Section 5.6 and *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.2 to Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.13*.

17.3.2 The fire detection, control and alarm systems are to be provided with an emergency source of electrical power required by *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships* or *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships* and are also to be connected to the main source of electrical power. Separate feeders, reserved solely for this purpose, with automatic changeover facilities located in, or adjacent to, the main control panel are to be provided.

17.3.3 Failure of any power supply is to operate an audible and visual alarm. See also *Pt 6, Ch 2, 1.14 Alarms* and *Pt 6, Ch 2, 1.15 Labels, signs and notices*.

17.3.4 Means to activate a system are to be located at easily accessible positions inside and outside the protected space. Arrangements inside the space are to be situated such that they will not be cut off by a fire in the protected areas and are suitable for activation in the event of escape. Where it is proposed to install local activation means outside of the protected space, details are to be submitted for consideration.

17.3.5 As far as is practicable, electrical and electronic equipment is not to be located within protected areas or adjacent areas.

17.3.6 High voltage equipment and their enclosures are not to be installed in protected areas or adjacent areas. For high voltage generators enclosures which cannot be fully located outside of adjacent areas due to close proximity, a technical justification, including proposed degree of protection ratings that are normally not to be lower than IP54, may be submitted for consideration that demonstrates the overall safety of the installation in the event of system operation.

17.3.7 In addition to the degree of protection requirements of *Pt 6, Ch 2, 1.11 Location and construction 1.11.1*, electrical and electronic equipment enclosures located within protected areas and within adjacent areas are to provide adequate protection in the event of system operation.

17.3.8 To demonstrate compliance with *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.7*, evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas is to be submitted in accordance with *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.13*. The evidence is to demonstrate that additional precautions have been taken, where necessary, in respect of:

- (a) satisfying *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.5* and *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.6*;
- (b) personnel protection against electric shock;
- (c) cooling airflow, where necessary, for equipment required to operate during system operation; and
- (d) maintenance requirements for equipment before return to operation following system activation.

Any test evidence submitted is to consider the overall installation, including equipment types, system configuration and nozzles and the potential effects of airflows in the protected space.

17.3.9 The evidence required by *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.8* is to demonstrate the safe and effective operation of the overall arrangements in the event of system operation. This evidence is to demonstrate that exposure to system spray and/or water:

- cannot result in loss of essential services (e.g. unintended activation of automatic machinery shutdown);
- cannot result in loss of availability of emergency services;
- will not affect the continued safe and effective operation of electrical and electronic equipment required to operate during the required period of system operation;
- does not present additional electrical or fire hazards; and
- would require only identified readily replaceable components to be repaired or replaced.

The installation of electrical and electronic equipment required to provide essential or emergency services in enclosures with a degree of protection less than IP44 within areas exposed to direct spray is to be acceptable to LR, and evidence of suitability is to be submitted accordingly.

17.3.10 Fixed water-based local application fire-fighting system electrically driven pumps may be shared with:

- equivalent automatic sprinkler systems;
- equivalent main machinery space fire-fighting systems; or
- local fire-fighting systems for deep-fat cooking equipment;

provided that the shared use is accepted by the National Administration as complying with applicable statutory regulations and the arrangements comply with the requirements of *Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.11 to Pt 6, Ch 2, 17.3 Fixed water-based local application fire-fighting systems 17.3.13*.

17.3.11 Shared electrically driven sea-water pumps are to be served by not less than two circuits reserved solely for this purpose, one fed from the main source of electrical power and one from the emergency source of electrical power. Such feeders are to be connected to an automatic changeover switch situated near the pumps and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.

17.3.12 Failure of a component in the power and control system is not to result in a reduction of the total available pump capacity below that required by any of the areas which the system is required to protect. For equivalent automatic sprinkler systems, a failure is not to prevent automatic release or reduce sprinkler pump capacity by more than 50 per cent.

17.3.13 Where fire-fighting systems share fire-fighting pumps, failure of one system is not to prevent activation of the pumps by any other system.

17.4 Fire pumps

17.4.1 When the emergency fire pump is electrically driven, the power is to be supplied by a source other than that supplying the main fire pumps. This source is to be located outside the machinery spaces containing the main fire pumps and their source of power and drive units.

17.4.2 The cables to the emergency fire pump are not to pass through the machinery spaces containing the main fire pumps and their source of power and drive units. The cables are to be of a fire-resistant type where they pass through other high fire risk areas.

17.5 Fixed gas fire-extinguishing systems

17.5.1 Where there are electrically operated fixed gas fire-extinguishing systems, they are to comply with *Chapter 5 - Fixed Gas Fire-Extinguishing Systems* of the FSS Code.

17.5.2 Where there are electrically driven refrigeration units for carbon dioxide fire-extinguishing systems, one unit is to be supplied by the main source of electrical power and the other unit from the emergency source of electrical power.

17.5.3 Each electrically driven carbon dioxide refrigerating unit is to be arranged for automatic operation in the event of loss of the alternative unit.

17.5.4 Where it is required that alarms be provided to warn of the release of a fire-extinguishing medium, and these are electrically operated;

- they are to be provided with an emergency source of electrical power, as required by *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships* or *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships*;
- also connected to the main source of electrical power, with automatic changeover facilities located in, or adjacent to, the fire-extinguishing media release panel, see also *Pt 6, Ch 2, 1.14 Alarms*; and
- Failure of any power supply is to operate an audible and visual alarm, see also *Pt 6, Ch 2, 1.14 Alarms* and *Pt 6, Ch 2, 1.16 Operation under fire conditions*

17.5.5 The opening of the fire-extinguishing media control cabinet door, or panel, for any purpose other than for the release of the fire-extinguishing media, is not to cause the loss of any essential services, see *Pt 6, Ch 2, 1.6 Definitions 1.6.1*.

17.6 Fire safety stops

17.6.1 In order to limit the fire growth potential in every space of the ship, means for controlling the air supply to the spaces and flammable liquids within the spaces are to comply with SOLAS Chapter II-2, Part B, *Regulation 5 - Fire growth potential*.

17.6.2 In passenger ships, the control and indication arrangements at the central control station are to comply with SOLAS Chapter II-2, Part A, *Regulation 3 - Definitions*.

17.6.3 In passenger ships and cargo ships, to which SOLAS 1974 as amended applies, exhaust ducts from main laundries, drying rooms and galley ranges are to be fitted with additional remote-control arrangements as required by SOLAS, Chapter II-2, Part C, *Regulation 9 - Containment of fire*, Section 7.

17.6.4 To control flammable liquids, a means of stopping all fuel oil, lubricating oil, hydraulic oil, cargo oil and thermal oil pumps, oil purifiers from outside the spaces being served is to be provided. The position is not to be cut off in the event of a fire.

17.6.5 Means of cutting off all electrical power to the galley except lighting circuits, in the event of a fire, is to be provided outside the galley exits, at positions which will not readily be rendered inaccessible by such a fire. Consideration may be given to relaxing this requirement for supplies to equipment not used for heating or cooking (e.g. alarm and clock systems) that do not present an electrical shock risk to fire-fighting personnel.

17.6.6 Following activation of any fire safety stops, a manual reset is to be provided in order to restart the associated equipment.

17.6.7 Fire safety stop systems are to be designed on the fail safe principle or alternatively the power supplies to, and the circuits of, the fire safety stop systems are to be continuously monitored and an alarm initiated in the event of a fault. Cables are to be of a fire-resistant type, see *Pt 6, Ch 2, 11.5 Construction 11.5.3*. See also *Pt 6, Ch 2, 5.2 Essential services 5.2.1*.

17.7 Fire doors

17.7.1 The electrical power required for the control, indication and alarm circuits of fire doors is to be provided by an emergency source of electrical power as required by *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships*. In passenger ships carrying more than 36 passengers an alternative supply fed from the main source of electrical power, with automatic change over facilities, is to be provided at the central control station. Failure of any power supply is to operate an audible and visual alarm, see also *Pt 6, Ch 2, 1.14 Alarms* and *Pt 6, Ch 2, 1.16 Operation under fire conditions*.

17.7.2 The control and indication systems for the fire doors are to be designed on the fail-safe principle with the release system having a manual reset.

17.8 Fire dampers

17.8.1 The electrical power required for the control and indication circuits of fire dampers is to be supplied from the emergency source of electrical power, see also *Pt 6, Ch 2, 1.16 Operation under fire conditions*.

17.8.2 The control and indication systems for the fire dampers are to be designed on the fail-safe principle with the release system having a manual reset.

17.8.3 In passenger ships and cargo ships, to which SOLAS 1974 as amended applies, where electrically operated fire dampers are fitted in main laundries, drying rooms and galley ranges, they are to be as required by SOLAS, Ch II-2, Part C, *Regulation 9 - Containment of fire*, Section 7.

17.9 Safety centre on passenger ships

17.9.1 Safety centres on passenger ships are to comply with SOLAS Chapter II-2, Part G, *Regulation 23 - Safety centre on passenger ships*.

17.9.2 Operation, control and/or monitoring facilities provided at the safety centre are additional to any dedicated facilities required at other locations by the Rules or the National Administration.

17.9.3 Where arrangements are operated, controlled and/or monitored from the safety centre in accordance with *Pt 6, Ch 2, 17.9 Safety centre on passenger ships 17.9.2*, they are to comply with the relevant requirements of *Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems* in respect of control, alarm and programmable electronic systems.

17.10 Electrically powered air compressors for breathing air cylinders

17.10.1 In passenger ships carrying more than 36 passengers where electrically powered air compressors are installed they are to be in accordance with SOLAS, Chapter II-2, Part C, *Regulation 10 - Fire fighting*, Section 10.2.6.1.

■ Section 18

Crew and passenger emergency safety systems

18.1 Emergency lighting

18.1.1 For the purpose of this Section emergency lighting, transitional emergency lighting and supplementary emergency lighting are hereafter referred to under the generic name 'emergency lighting'.

18.1.2 Emergency lighting provided in compliance with *Pt 6, Ch 2, 3 Emergency source of electrical power* is to be arranged so that a fire or other casualty in the spaces containing the emergency source of electrical power, associated transforming equipment and the emergency lighting switchboard does not render the main lighting system inoperative.

18.1.3 The level of illumination provided by the emergency lighting is to be adequate to permit safe evacuation in an emergency, having regard to the possible presence of smoke, see *Pt 6, Ch 2, 18.4 Escape route or low location lighting (LLL)*.

18.1.4 The locations identified in *SOLAS - International Convention for the Safety of Life at Sea Chapter II-1 - Construction - Structure, subdivision and stability, machinery and electrical installations, Part D - Electrical installations, Regulation 41 - Main source of electrical power and lighting systems, Regulation 42 - Emergency source of electrical power in passenger ships and Regulation 43 - Emergency source of electrical power in cargo ships*, and the exits from accommodation spaces and service spaces, as defined by *SOLAS - International Convention for the Safety of Life at Sea Chapter II-2 - Construction - Fire protection, fire detection and fire extinction, Part A - General Regulation 3 - Definitions* are to be illuminated by emergency lighting.

18.1.5 Switches are not to be installed in the final sub-circuits to emergency light fittings unless the light fittings are serving normally unmanned spaces (e.g. storage-rooms, cold rooms, etc.), or they are normally required to be extinguished for operational reasons (e.g. for night visibility from the navigating bridge). Where switches are fitted they are to be accessible only to ship's crew with provision made to ensure that the emergency lighting is energised when such spaces are manned and/or during emergency conditions.

18.1.6 Where emergency lighting fittings are connected to dimmers, provision is to be made, upon the loss of the main lighting, to automatically restore them to their normal level of illumination.

18.1.7 Fittings are to be specially marked to indicate that they form part of the emergency lighting system.

18.2 General emergency alarm system

18.2.1 An electrically operated bell or klaxon or air-operated whistle with independent air supply or other equivalent warning system installed in addition to the ship's whistle or siren, for sounding the general emergency alarm signal is to comply with the *LSA Code - International Life-Saving Appliance Code – Resolution MSC.48(66)* and with the requirements of this Section, see also *Pt 6, Ch 2, 1.14 Alarms* and *Pt 6, Ch 2, 1.16 Operation under fire conditions*.

18.2.2 The main and emergency sources of supply to the general emergency alarm system shall be in accordance with *LSA Code*, Chapter VII, 7.2 *General alarm and public address system*. For General emergency alarm systems refer to the *IMO Code on Alerts and Indicators, 2009, 4 General*.

18.2.3 In conjunction with the *IMO Code on Alerts and Indicators, 2009 4 General* the general emergency alarm distribution system is to be so arranged that a fire or casualty in any one main vertical zone, as defined by *SOLAS Chapter II-2, Part A, Regulation 3 - Definitions*, other than the zone in which the public address control station is located, will not interfere with the distribution in any other such zone.

18.2.4 There are to be segregated cable routes to public rooms, alleyways, stairways, control stations and on passenger ships on open decks, so arranged that any single electrical fault, localised fire or casualty will not cause the loss of the facility to sound the general emergency alarm in any public rooms, alleyways, stairways, control stations and on passenger ships on open decks, albeit at a reduced capacity.

18.2.5 Where the special alarm fitted to summon the crew, operated from the navigation bridge, or fire control station, forms part of the ship's general alarm system, it is to be capable of being sounded independently of the alarm to the passenger spaces.

18.2.6 The sound pressure levels are to be measured during a practical test and documented, see *Pt 6, Ch 2, 21.2 Trials*.

18.3 Public address system

18.3.1 Public address systems on passenger ships and cargo ships used to sound the general emergency alarm or the fire-alarm are to comply with SOLAS Ch III, Part B, Regulation 6, Sections 4 and 5, the *LSA Code - International Life-Saving Appliance Code – Resolution MSC.48(66)*, *Code on Alerts and Indicators, 2009*, and the requirements of this Section.

18.3.2 The public address system is to be provided with an emergency source of electrical power in accordance with SOLAS Ch III, Part B, Regulation 6, Section 5.4 with automatic changeover facilities located adjacent to the public address system. Failure of any power supply is to operate an audible and visual alarm, in accordance with *LSA Code, Chapter VII - Other Life-Saving Appliances and Code on Alerts and Indicators, 2009, 4 General*.

18.3.3 The public address system is to have multiple amplifiers having their power supplies so arranged that a single fault will not cause the loss of the facility to broadcast emergency announcements in public rooms, alleyways, stairways and control stations, albeit at a reduced capacity, for passenger vessels it is to be in accordance with *MSC/Circular.808 – Recommendation on Performance Standards for Public Address Systems on Passenger Ships, Including Cabling – (Adopted on 30 June 1997)*, Sections 2.5 - 2.7.

18.3.4 The public address distribution system is to be so arranged that a fire or casualty in any one main vertical zone, as defined by SOLAS 1974 as amended Reg II-2/A, Regulation 3 - Definitions, other than the zone in which the public address control station is located, will not interfere with the distribution in any other such zone.

18.3.5 There are to be at least two cable routes, sufficiently separated throughout their length, to public rooms, alleyways, stairways and control stations so arranged that any single electrical fault, fire or casualty will not cause the loss of the facility to broadcast emergency announcements in any public rooms, alleyways, stairways, and control stations, albeit at a reduced capacity. Refer to SOLAS Chapter III - Life-saving appliances and arrangements.

18.3.6 Amplifiers are to be continuously rated for the maximum power that they are required to deliver into the system for audio and, where alarms are to be sounded through the public address system, for tone signals.

18.3.7 Loudspeakers are to be continuously rated for their proportionate share of amplifier output and protected against short-circuits and passenger vessels are to be in compliance with *MSC/Circular.808 – Recommendation on Performance Standards for Public Address Systems on Passenger Ships, Including Cabling – (Adopted on 30 June 1997)*.

18.3.8 Amplifiers and loudspeakers are to be selected and arranged to prevent feedback and other interference. There are also to be means to automatically override any volume controls, so as to ensure the specified sound pressure levels are met. In addition the requirements of MSC Circular 808 for passenger vessels are required.

18.3.9 Where the public address system is used for sounding the general emergency alarm and the fire-alarm, the requirements as per *IMO Code on Alerts and Indicators, 2009, 5 Audible Presentation of Alerts and Calls* and *5 Audible Presentation of Alerts and Calls* are to be met.

18.3.10 Where more than one alarm is to be sounded through the public address system, the requirements are in accordance with *Code on Alerts and Indicators, 2009 5 Audible Presentation of Alerts and Calls*.

18.3.11 The sound pressure levels are to be measured during a practical test using speech and, where applicable, tone signals, and documented, see Pt 6, Ch 2, 21.2 Trials.

18.4 Escape route or low location lighting (LLL)

18.4.1 The escape route or low location lighting (LLL) required by SOLAS 1974, as amended Pt D, Ch II-2, Regulation 13 - Means of escape, 3.2.5.1, where satisfied by electric illumination, is to comply with the requirements of this sub-Section. The positional marking of lighting or photo luminescent strip indicators is to be in accordance with SOLAS Ch II-2 Pt D, Regulation 13 - Means of escape, 3.2.5.1.

18.4.2 The LLL system is to be provided with an emergency source of electrical power as required by Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships and also be connected to the main source of electrical power, with automatic changeover facilities located adjacent to the control panel, see also Pt 6, Ch 2, 1.16 Operation under fire conditions.

18.4.3 The power supply arrangements to the LLL are to be arranged so that a single fault or a fire in any one fire zone or deck does not result in loss of the lighting in any other zone or deck. This requirement may be satisfied by the power supply circuit configuration, use of fire-resistant cables complying with Pt 6, Ch 2, 11.5 Construction 11.5.3, and/or the provision of suitably located power supply units having integral batteries adequately rated to supply the connected LLL for a minimum period of 60 minutes, see Pt 6, Ch 2, 12.3 Location 12.3.8. Manual activation is to be in accordance with *IMO Resolution A.752(18) – Guidelines for the Evaluation, Testing and Application of Low-Location Lighting on Passenger Ships – (Adopted on 4 November 1993)*.

18.4.4 For the recommendation of performance and installation of lights and lighting assemblies refer to ISO Standard 15370:2001 *Ships and marine technology - Low location lighting on passenger ships*.

■ Section 19 Ship safety systems

19.1 Watertight doors

19.1.1 Power operated sliding watertight doors including power supply, power supply availability, control, indication and alarm circuits for passenger ships are to comply with SOLAS Ch II-1, Regulation 13.7.1 to 13.7.8.

19.1.2 The enclosures of electrical components including their electric control cables for passenger ships are to be in compliance with SOLAS Ch II-1, Regulation 13.7.6

19.1.3 For passenger ships, an audible alarm and where required supplemented by a visual signal at the door when the watertight doors are operated from remote is to be in accordance with SOLAS Ch II-1, Regulation 13.7.1.6.

19.1.4 For the necessity of a centralised operating console located on the navigation bridge on passenger vessels, it is to comply with SOLAS Ch II-1, Regulation 13.8.1 to 13.8.3.

19.1.5 The sliding watertight doors on cargo ships are to comply with the following requirements:

- (a) SOLAS Ch II-1, Regulation 13-1 - Openings in watertight bulkheads and internal decks in cargo ships.
- (b) Provisions are to be made as follows:
 - (i) The electrical power required for power-operated sliding watertight doors is to be separate from any other power circuit and supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the bulkhead deck. The associated control, indication and alarm circuits are to be supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the bulkhead deck.
 - (ii) A single failure in the power operating or control system of power-operated sliding watertight doors is not to result in a closed door opening or preventing the hand operation of any door.
 - (iii) Availability of the power supply is to be continuously monitored at a point in the electrical circuit adjacent to the door operating equipment. Loss of any such power supply is to activate an audible and visual alarm at the central operating console on the navigating bridge.
 - (iv) Electrical power, control, indication and alarm circuits are to be protected against fault in such a way that a failure in one door circuit will not cause a failure in any other door circuit. Short-circuits or other faults in the alarm or indicator circuits of a door are not to result in a loss of power operation of the door. Arrangements are to be such that leakage of water into the electrical equipment located below the bulkhead deck will not cause the door to open.
 - (v) The enclosures of electrical components necessarily situated below the bulkhead deck are to provide suitable protection against the ingress of water with ratings as defined in IEC 60529: Degrees of protection provided by enclosures (IP Code), or an acceptable and relevant National Standard, are as follows:
 - Electrical motors, associated circuits and control components, protected to IPX7 Standard.
 - Door position indicators and associated circuit components protected to IPX8 Standard, where the water pressure testing of the enclosures is to be based on the pressure that can occur at the location of the component during flooding for a period of 36 hours.
 - Door movement warning signals, protected to IPX6 Standard.
 - (vi) Watertight door electrical controls including their electric cables are to be kept as close as is practicable to the bulkhead in which the doors are fitted and so arranged that the likelihood of them being involved in any damage which the ship can sustain is minimised.
 - (vii) An audible alarm, distinct from any other alarm in the area, is to sound whenever the door is closed remotely by power, and sound for at least five seconds but no more than ten seconds before the door begins to move and is to continue sounding until the door is completely closed. The audible alarm is to be supplemented by an intermittent visual signal at the door and in areas where the noise level exceeds 85 dB(A).
 - (viii) Sliding watertight doors on cargo ships are to be capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure.

19.2 Stern and side shell doors and bow and inner doors

19.2.1 The requirements of *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.2 to Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.14* apply to all stern and side shell doors, bow doors and inner doors, giving access to vehicle decks, and subdivision doors, in accordance with *Pt 4, Ch 2, 9 Subdivision structure on vehicle deck*, on all ships except where otherwise stated in *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.11* and *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.12*.

19.2.2 A notice is to be displayed at the operating panel stating that the door is to be fully closed, secured and locked preferably before, or immediately the ship leaves the berth and that this operation is to be entered in the ship's log.

19.2.3 Control positions are to be provided with a system of warning indicator lights. The system is to provide positive indication that the door is fully closed, secured and locked. The indication arrangements are to be 'fail-safe' such that in the event of a fault the system cannot incorrectly indicate that the doors are fully closed, secured or locked.

19.2.4 The indication system is to be arranged such that it functions independently of any system for door operation, securing and locking.

19.2.5 The electrical power supply for the indication system is to be independent of any electrical power supply for operating, securing and locking the doors.

19.2.6 The indication system is to be fed from two exclusive circuits, one from the main source of electrical power and one from the emergency source of electrical power with automatic changeover facilities located adjacent to the panel. Loss of either active or standby power supply is to initiate an audible and visual alarm on the navigation bridge.

19.2.7 The indicator panel is to be provided with a lamp test function. It is not to be possible to turn off the indication lights at the panel. Dimming facilities may be provided, but the indications are to remain clearly readable under all operating lighting conditions.

19.2.8 Means are to be provided to prevent unauthorised operation of the doors and associated securing and locking devices.

19.2.9 Detection of door position and securing and locking device status is to be by direct sensing of proximity, contact or equivalent, not inferred from actuator positions. Sensors are to be protected against ice formation, mechanical damage and water ingress to be not less than IPX6 Standard as defined in IEC 60529: *Degrees of protection provided by enclosures (IP Code)*, or an acceptable and relevant National Standard.

19.2.10 Where a strongback or equivalent independent secondary means of securing an inwardly opening door is required, these need not be monitored by the indication system providing their correct positioning can be easily observed from the control position.

19.2.11 Doors with a clear opening area of 12 m² or greater are to be provided with closing devices operable from a remote control position. Doors which are located partly or totally below the freeboard deck with a clear opening area greater than 6 m² are to be provided with an arrangement for remote control from a position above the freeboard deck. This remote control is to provide centralised control for:

- (a) The closing and opening of the doors.
- (b) Associated securing and locking devices.

19.2.12 Bow doors and inner doors, giving access to vehicle decks, and subdivision doors are to be provided with an arrangement for remote control from a position above the freeboard deck, providing centralised control for:

- (a) the closing and opening of the doors; and
- (b) associated securing and locking devices.

19.2.13 The location of the remote control panel is to be such that door operation can be easily observed by the operator or by other suitable means such as closed circuit television. Where remote control is required, television surveillance or other such means may satisfy this requirement.

19.2.14 A drainage system is to be arranged in the area between bow door and ramp or, where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible alarm function on the navigation bridge being set off when the water levels in these areas exceed 0,5 m.

19.2.15 The additional requirements of *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.16 to Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.22* apply to stern and side shell doors in the boundaries of special category spaces or ro-ro cargo spaces through which such spaces may be flooded, and to bow doors and inner doors. For cargo ships, where no part of the door is below the uppermost waterline and the area of the door opening is not greater than 6

m², the requirements of *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.16* to *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors 19.2.22* need not be applied.

19.2.16 An indicator panel is to be located on the navigating bridge, providing separate visual indications of the position of each door and the status of their associated securing/locking devices.

19.2.17 The indication system is to be provided with a 'harbour/sea voyage' mode selection function, with means of operation located on or adjacent to the navigating bridge indication panel. The selected mode is to be displayed on all indicator panels. An audible alarm is to be initiated on the navigating bridge if the ship leaves the harbour with any door not fully closed or not fully secured. Where practical, the alarm should be initiated immediately the ship leaves the berth. Audible alarms are to be silenced in the 'harbour' mode. Visual indications are to remain operational in either mode.

19.2.18 An audible and visual alarm is to be given on the navigation bridge in the event of any fault within the indication system.

19.2.19 An audible and visual alarm is to be initiated on the navigation bridge and the engine control room, or an equivalent attended position, in the event of leakage through the doors.

19.2.20 Television surveillance arrangements are to be provided to enable the positions of bow doors and inner doors, and a sufficient number of their closing devices, to be monitored from the navigation bridge and the engine control room, or an equivalent attended position. The television surveillance arrangements are also to allow leakage through the bow doors and inner doors to be assessed from the same positions in the event of leakage through the doors. Special consideration is to be given to the lighting and contrasting colour of objects under surveillance.

19.2.21 For passenger ships, television surveillance arrangements are to be provided to allow leakage through stern and side shell doors below the freeboard deck to be assessed from the navigation bridge and the engine control room, or equivalent attended position.

19.2.22 The electrical power supply for surveillance lighting is to be independent of any electrical power supply for operating, securing and locking the doors.

19.3 Subdivision doors on vehicle decks

19.3.1 Where subdivision doors are provided on passenger ship vehicle decks in accordance with *Pt 4, Ch 2, 9 Subdivision structure on vehicle deck*, the control and monitoring arrangements for these doors are to generally comply with *Pt 6, Ch 2, 19.2 Stern and side shell doors and bow and inner doors*.

19.4 Bilge pumps

19.4.1 Where the bilge pumps for the holds of open-top container ships are electrically driven one pump is to be supplied from the emergency switchboard, the remaining pumps are to be supplied from the main source of electrical power, independent of the emergency switchboard.

■ **Section 20** **Lightning conductors**

20.1 General

20.1.1 In order to minimise the risks of damage to the ship and its electrical installation due to lightning, ships having non-metallic masts or topmasts are to be fitted with lightning conductors in accordance with the applicable requirements of IEC 60092-401: *Electrical installations in ships - Part 401: Installation and test of completed installation* or an alternative and relevant National Standard.

■ Section 21

Testing and trials

21.1 Testing

21.1.1 Tests in accordance with *Pt 6, Ch 2, 21.1 Testing 21.1.2* are to be satisfactorily carried out on all electrical equipment, complete or in sections, at the manufacturer's premises and a test report issued by the manufacturer.

21.1.2 A high voltage at any frequency between 25 and 100Hz is to be applied between:

- (a) all current carrying parts connected together and earth;
- (b) all current carrying parts of opposite polarity or phase.

For rotating machines the value of test voltage is to be 1000 V plus 2 x rated voltage with a minimum of 2000 V, and for other electrical equipment, it is to be in accordance with *Table 2.21.1 Test voltage*. Items of equipment included in the assembly for which a test voltage lower than the above is specified may be disconnected during the test and tested separately at the appropriate lower test voltage. The test is to be commenced at a voltage of about one-third the test voltage and is to be increased to full value as rapidly as is consistent with its value being indicated by the measuring instrument. The full test voltage is then to be maintained for 1 minute, and then reduced to one-third full value before switching off. The assembly is considered to have passed the test if no disruptive discharge occurs.

21.1.3 When it is desired to make additional high voltage tests on equipment which has already passed its tests, the voltage of such additional tests is to be 80 per cent of the test voltage the equipment has already passed.

Table 2.21.1 Test voltage

Rated voltage, U_n U_n V	Test voltage a.c. (r.m.s.), V
$U_n \leq 60$	500
$60 < U_n \leq 1000$	$2 \times U_n + 1000$
$1000 < U_n \leq 2500$	6500
$2500 < U_n \leq 3500$	10000
$3500 < U_n \leq 7200$	20000
$7200 < U_n \leq 12000$	28000
$12000 < U_n \leq 15000$	38000

21.1.4 Immediately after the high voltage test, the insulation resistance is to be measured using a direct current insulation tester, between:

- (a) all current-carrying parts connected together and earth;
- (b) all current-carrying parts of different polarity or phase.

The minimum values of test voltage and insulation resistance are given in *Table 2.21.2 Test voltage and minimum insulation*.

Table 2.21.2 Test voltage and minimum insulation

Rated voltage U_n V	Minimum voltage of the tests, V	Minimum insulation resistance, $M\Omega$
$U_n \leq 250$	$2 \times U_n$	1
$250 < U_n \leq 1000$	500	1

$1000 < U_n \leq 7200$	1000	$\frac{U_n}{1000} + 1$
$7200 < U_n \leq 15000$	5000	$\frac{U_n}{1000} + 1$

21.1.5 Tests in accordance with the Standard with which the equipment complies may be accepted as an alternative to the above.

21.1.6 Tests at the manufacturers' works and trials after installation on board are to include such tests necessary to demonstrate, to the Surveyor's satisfaction, the suitability and safety of the lithium battery system for its intended duty and location. As a minimum, the tests listed in *Table 2.21.3 Test requirements on lithium battery systems* are required:

Table 2.21.3 Test requirements on lithium battery systems

Item	Tests	Trials
Discharge performance validation	X	
Capacity validation test *	X	X
Internal d.c. resistance test	X	
Overcharge control test	X	
Cell balancing functional test	X	
Sensor failures test	X	
SOC validation test *	X	X
SOH validation test *	X	X
High voltage test	X	
Insulation resistance test	X	
Emergency trip functional test *	X	X
Over-temperature protection test	X	X
Over-voltage protection test	X	X
Under-voltage protection test	X	X
Communication failure between BMS and external charge control system test *	X	X
Pressure relief valve test	X	
Additional safety functions tests and trials of the battery management system	X	X
Note . Items marked * are required to be tested annually.		

21.2 Trials

21.2.1 Before a new installation, or any alteration or addition to an existing installation, is put into service the applicable trials in *Pt 6, Ch 2, 21.2 Trials 21.2.2 to Pt 6, Ch 2, 21.2 Trials 21.2.7* are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturer's works and are to be to the Surveyor's satisfaction.

21.2.2 The insulation resistance is to be measured of all electrical power circuits and electrical equipment, using a direct current insulation tester, between:

- all current-carrying parts connected together and earth and, so far as is reasonably practicable;
- all current-carrying parts of different polarity or phase;

The minimum values of test voltage and insulation resistance are given in *Table 2.21.2 Test voltage and minimum insulation*. The installation may be subdivided and appliances may be disconnected if initial tests produce results less than these figures.

21.2.3 Tests are to be made to verify the effectiveness of:

- (a) earth continuity conductor;
- (b) the earthing of non-current-carrying exposed metal parts of electrical equipment and cables not exempted by *Pt 6, Ch 2, 1.12 Earthing of non-current carrying parts 1.12.2*;
- (c) bonding for the control of static electricity.

21.2.4 It is to be demonstrated that the Rules have been complied with in respect of:

- (a) satisfactory performance of each generator throughout a run at full rated load;
- (b) temperature of joint, connections, circuit-breakers and fuses;
- (c) the operation of engine governors, synchronising devices, overspeed trips, reverse-current, reverse-power and over-current trips and other safety devices;
- (d) voltage regulation of every generator when full rated load is suddenly thrown off and when starting the largest motor connected to the system;
- (e) voltage drop at the worst case condition;
- (f) harmonic distortion of the voltage waveform. Where harmonic filters are installed the calculation results provided by the system integrator are to be verified by the Surveyor. Simulation on trials of harmonic filter failure that would result in THD levels calculated to be higher than the acceptable limit are to be avoided. *See Pt 6, Ch 2, 5.11 Harmonic filtering*.
- (g) satisfactory parallel operation, and kW and KVA load sharing of all generators capable of being operated in parallel at all loads up to normal working load;
- (h) all essential and other important equipment are to be operated under service conditions, though not necessarily at full load or simultaneously, for a sufficient length of time to demonstrate that they are satisfactory;
- (i) propulsion equipment is to be tested under working conditions and operated in the presence of the Surveyors and to their satisfaction. The equipment is to have sufficient power for going astern to secure proper control of the ship in all normal circumstances. In passenger ships the ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum ahead service speed, is to be demonstrated at the sea trial; and
- (j) the operation of the propulsion system with the harmonic filter removed from circuit is to be verified in accordance with the design intent, *see Pt 6, Ch 2, 16.5 Harmonic filtering for propulsion 16.5.2*; any operational and functional limitations are to be documented and details retained on board; and
- (k) operation of power management for electric propulsion.

21.2.5 Measurements are to be taken as part of the trials specified in *Pt 6, Ch 2, 21.2 Trials 21.2.4.(c)*, *Pt 6, Ch 2, 21.2 Trials 21.2.4.(d)*, *Pt 6, Ch 2, 21.2 Trials 21.2.4.(e)* and *Pt 6, Ch 2, 21.2 Trials 21.2.4.(f)* to verify that the installation will provide a quality of power supply in accordance with the values listed in *Pt 6, Ch 2, 1.8 Quality of power supplies*.

21.2.6 Satisfactory load management in accordance with *Pt 6, Ch 2, 6.9 Load management* is to be demonstrated. The demonstration is to include verification that the requirements of *Pt 6, Ch 2, 1.8 Quality of power supplies* will be met following disconnection of a generator under all defined operating profiles as agreed with the operators.

21.2.7 It is to be demonstrated by practical tests that the Rules have been complied with in respect of fire, crew and passenger emergency and ship safety systems.

21.2.8 On completion of the general emergency alarm system and the public address system tests, the Surveyor is to be provided with two copies of the test schedule, detailing the measured sound pressure levels. Such schedules are to be signed by the Surveyor and the Builder.

21.3 High voltage cables

21.3.1 Before a new high voltage cable installation, or an addition to an existing installation, is put into service a voltage withstand test is to be satisfactorily carried out on each completed cable and its accessories. The test is to be carried out after the insulation resistance test required by *Pt 6, Ch 2, 21.2 Trials 21.2.2* and may use either an a.c. voltage at power frequency or a d.c. voltage.

21.3.2 When an a.c. voltage withstand test is carried out, the voltage is to be not less than the normal operating voltage of the cable and it is to be maintained for a minimum of 24 hours.

21.3.3 When a d.c. voltage withstand test is carried out, the voltage is to be not less than:

- (a) $1,6 (2,5U_0 + 2 \text{ kV})$ for cables of rated voltages (U_0) up to and including 3,6 kV, or
- (b) $4,2U_0$ for higher rated voltages

where U_0 is the rated power frequency voltage between conductor and earth or metallic screen, for which the cable is designed.

The test voltage is to be maintained for a minimum of 15 minutes. After completion of the test the conductors are to be connected to earth for a sufficient period in order to remove any trapped electrical charge. An insulation resistance test in accordance with *Pt 6, Ch 2, 21.2 Trials 21.2.2* is then to be repeated.

21.4 On-line partial discharge testing of high voltage rotating machines for essential services

21.4.1 Where on-line partial discharge monitoring equipment is installed for the monitoring of high voltage rotating machines used to provide essential services, the method used is to be appropriate for the design and application of the rotating machine, and conducted and recorded in accordance with:

- (a) PD IEC/TS 60034-27-2:2012, *Rotating electrical machines Part 27-2: On-line partial discharge measurements on the stator winding insulation of rotating electrical machines*;
- (b) DD IEC/TS 61934:2011, *Electrical insulating materials and systems – Electrical measurement of partial discharges (PD) under short rise time and repetitive voltage impulses*; or
- (c) an alternative International or National Standard acceptable to LR.

21.4.2 The partial discharge measurement method used is to be acceptable to the rotating machine manufacturer. Particular attention is to be given to ensuring that:

- the test voltage and frequency (i.e. a.c., or ultra-low frequency and voltage level), and method selected are to be compatible with the insulation systems; and
- the tests do not over stress or cause accelerated ageing of the insulation system.

21.4.3 The test reports required by *Pt 6, Ch 2, 21.4 On-line partial discharge testing of high voltage rotating machines for essential services 21.4.1* are to:

- record the method and equipment used in sufficient detail to ensure that the tests can be repeated consistently throughout the service life of the rotating machine; and
- include, but are not limited to, the details recommended by the test standard to be applied.

21.4.4 Where partial discharge monitoring equipment has been installed in accordance with *Pt 6, Ch 2, 21.4 On-line partial discharge testing of high voltage rotating machines for essential services 21.4.1*, to enable through-life trend analysis:

- (a) measurements are to be recorded at harbour acceptance trials or sea trials to baseline the partial discharge characteristics of the rotating machine, and then repeated annually; and
- (b) a copy of the test reports and data is to be retained on board and made available to the Surveyor on request.

21.5 Hazardous areas

21.5.1 All electric equipment located in hazardous areas is to be examined to ensure that it is of a type permitted by the Rules, has been installed in compliance with its certification, and that the integrity of the protection concept has not been impaired.

21.5.2 Alarms and interlocks associated with pressurised equipment and the ventilation of spaces located in hazardous areas are to be tested for correct operation.

21.6 Optical Fibre Communications Systems

21.6.1 The attenuation loss of single-mode optical fibre is to be tested prior to installation in accordance with IEC 61280: *Fibre-optic communication subsystem test procedures Part 4-2: Installed cable plant – Single-mode attenuation and optical return loss measurement*. The test is to be recorded in accordance with the standard. The documentation is to be retained on board and made available to the Surveyor on request. Acceptance of alternative standards will be subject to consideration by LR.

21.6.2 The attenuation loss of multi-mode optical fibre is to be tested prior to installation in accordance with IEC 61280: *Fibre-optic communication subsystem test procedures – Part 4-1: Installed cable plant – Multimode attenuation measurement*. The test is to be recorded in accordance with the standard. The documentation is to be retained on board and made available to the Surveyor on request. Acceptance of alternative standards will be subject to consideration by LR.

21.6.3 The tests required by *Pt 6, Ch 2, 21.6 Optical Fibre Communications Systems 21.6.1* and *Pt 6, Ch 2, 21.6 Optical Fibre Communications Systems 21.6.2* are to be repeated after installation using the same method as used for the pre-installation test.

The test is to be recorded in accordance with the standard; the documentation is to be retained on board and made available to the Surveyor on request. Acceptance of alternative standards will be subject to consideration by LR.

21.6.4 The results of the testing required by *Pt 6, Ch 2, 21.6 Optical Fibre Communications Systems 21.6.3* are to be validated against the communication system design specification to ensure that adequate optical power will be transmitted for correct system operation, see *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.10*.

■ **Section 22** **Spare gear**

22.1 General

22.1.1 It is recommended that adequate spares, together with the tools necessary for maintenance, or repair, be carried. The spares are to be determined by the Owner according to the design and intended service. The maintenance of the spares is the responsibility of the Owner.

■ **Section 23** **Ergonomic Lighting Design – ELD optional notation**

23.1 Objectives

23.1.1 The requirements in this Section are applicable where the optional class notation for ergonomic lighting design is requested.

23.1.2 The design and installation of indoor lighting is to facilitate visual task performance, safety and visual comfort. In order to achieve this goal the requirements of *Pt 6, Ch 2, 23.2 Positioning and installation* to *Pt 6, Ch 2, 23.6 Night vision* are to be complied with.

23.1.3 The requirements in this Section do not address emergency or navigational lighting.

23.2 Positioning and installation

23.2.1 In order to meet the ergonomic requirements of *Pt 6, Ch 2, 23.2 Positioning and installation* to *Pt 6, Ch 2, 23.6 Night vision* the positioning and installation of lights is to comply with *Pt 6, Ch 2, 23.2 Positioning and installation 23.2.2* to *Pt 6, Ch 2, 23.2 Positioning and installation 23.2.11*.

23.2.2 Natural lighting through the use of windows and doors is to be provided as far as practicable.

23.2.3 Lights are to be positioned, as far as practicable, in the same horizontal plane and arranged symmetrically to produce a uniform level of illumination.

23.2.4 Lights are to be positioned so as to reduce bright spots and shadows as far as possible.

23.2.5 Lights are to be positioned taking account of structures such as beams and columns etc. so the lighting is not blocked by these items.

23.2.6 Lights are not to be positioned in locations which would result in limited illumination.

23.2.7 Lights are to be positioned taking account of air-conditioning vents or fans, fire detectors, water sprinklers etc. so the lighting is not blocked by these items.

23.2.8 The position of lights configured to strips or tubes is, as far as practicable, to be at right angles to an operator's line of sight while the operator is located at their typical duty station.

23.2.9 Any physical hazards that provide a risk to operator safety are to be appropriately illuminated.

23.2.10 The positioning of lights is to consider the transfer of heat to adjacent surfaces.

23.2.11 Lights are to be positioned in locations that are easy to reach for lamp replacement or maintenance.

23.3 Luminance distribution

23.3.1 In order to provide even, fatigue-free illumination the requirements of *Pt 6, Ch 2, 23.3 Luminance distribution 23.3.2 to Pt 6, Ch 2, 23.3 Luminance distribution 23.3.6* are to be complied with.

23.3.2 The light levels falling on the plane in which a task is performed are to be suitable for the type of task, i.e. they are to consider the variation in the working planes.

23.3.3 Sharp contrasts in illumination levels across an operator task or working plane are to be avoided, as far as possible.

23.3.4 Sharp contrasts in illumination levels between an operator task area and the immediate surround and general background area are to be avoided, as far as possible.

23.3.5 Where required, local lighting for operational tasks is to be provided in addition to general lighting.

23.3.6 Lighting is to be free of perceived flicker.

23.4 Glare

23.4.1 In order to minimise glare (to avoid dazzle, discomfort and fatigue) the requirements of *Pt 6, Ch 2, 23.4 Glare 23.4.2 to Pt 6, Ch 2, 23.4 Glare 23.4.6* are to be complied with.

23.4.2 Lights are to be positioned so as to reduce, as far as possible, glare or high brightness reflections from working and display surfaces.

23.4.3 Lights are to be positioned so as to provide even illumination and minimal glare on controls, displays and indicators.

23.4.4 Where necessary, suitable blinds and shading devices are to be used to prevent glare.

23.4.5 Surfaces are to have a non-reflective or matt finish in order to reduce the likelihood of indirect glare.

23.4.6 Where a transparent cover is fitted over a control, display or indicator, it is to be designed to minimise reflections.

23.5 Location of lighting controls and outlets

23.5.1 In order to allow convenient use of lighting the requirements of *Pt 6, Ch 2, 23.5 Location of lighting controls and outlets 23.5.2 to Pt 6, Ch 2, 23.5 Location of lighting controls and outlets 23.5.6* are to be complied with.

23.5.2 The lighting system is to be easily maintained and operated by personnel.

23.5.3 Lighting is to be controllable locally in accommodation and working areas, except where this conflicts with safety requirements.

23.5.4 Light switches are to be fitted in safe positions for personnel.

23.5.5 The mounting height of switches is to be such that personnel can reach switches with ease.

23.5.6 Power outlets are to be provided where temporary, local, task lighting will be required, except in hazardous areas.

23.6 Night vision

23.6.1 In order to maintain night vision and facilitate safety during hours of darkness the requirements of *Pt 6, Ch 2, 23.6 Night vision 23.6.2 to Pt 6, Ch 2, 23.6 Night vision 23.6.4* are to be complied with.

23.6.2 Lighting on the ship's superstructure is to be directed away from, and shaded to prevent direct illumination of, the bridge windows and lookout points.

23.6.3 Instrument lighting is to be such that the operator can read dials and indicators without impediment of night vision.

23.6.4 Lighting of instruments, keyboards and controls is to be adjustable down to zero, except for the lighting of alarm and warning indicators and the controls of dimmers, which are to remain readable.

■ Section 24

Hybrid electrical power systems

24.1 Scope

24.1.1 The requirements of this Section are applicable to ships having a main source of electrical power which is provided by hybrid electrical power generation and distribution systems within which the main electrical power demand is supplied by two or more different types of power source or by stored electrical energy.

24.1.2 These requirements apply to the design, construction and integration of hybrid electrical power systems, their sub-systems, machinery and equipment.

24.1.3 These requirements apply to hybrid electrical power systems which provide the main source of electrical power and exceptionally, where permitted by the National Administration, the emergency source of electrical power.

24.1.4 In addition to these requirements National Administrations may impose further requirements. Where such requirements conflict with these requirements, the requirements of the National Administration will take precedence.

24.1.5 These requirements are additional to the applicable requirements of the *Rules and Regulations for the Classification of Ships, July 2021*.

24.2 Characters of classification and class notations (machinery special features)

24.2.1 Ships complying with the mandatory requirements of this Section will be assigned the **Hybrid Power** machinery special features notation.

24.2.2 Ships complying with both the mandatory requirements and the additional optional requirements of this Section will be assigned the **Hybrid Power (+)** machinery special features notation.

24.2.3 **Hybrid Power:** Assigned to ships with an electrical power system including a combination of two or more different types of power source or utilising stored electrical energy to satisfy the ship's main power demand. The system and its component parts are in accordance with the existing applicable requirements of the Rules and the requirements of *Pt 6, Ch 2, 24 Hybrid electrical power systems*.

24.2.4 **Hybrid Power (+):** Assigned to ships meeting the requirements for **Hybrid Power** and the additional optional requirements for **Hybrid Power (+)** specified within *Pt 6, Ch 2, 24 Hybrid electrical power systems*. The additional optional requirements aim to provide for enhanced performance of the electrical power system achieved through the consideration of system simulation, system integration and dependability of the electrical power system during normal or reasonably foreseeable abnormal operation.

24.3 Definitions

24.3.1 Hybrid electrical power system: A ship's electrical power system comprising sources, stores, consumers and distribution of electrical power together with their associated controls within which electrical power is provided by two or more different types of power source or utilising stored electrical energy to satisfy the ship's main power demand. This definition is independent of:

- (a) the type of distribution system (see *Pt 6, Ch 2, 24.3 Definitions 24.3.8*);
- (b) the types and ratings of source, their physical location and time duration of connection to the ship's power system;
- (c) the types of store;
- (d) the types of connected consumer; and
- (e) the presence or otherwise of electric propulsion.

24.3.2 Reasonably foreseeable abnormal condition: A reasonably foreseeable abnormal condition is an operation, event, incident or failure that:

- (a) has happened and could happen again;
- (b) has not happened but is considered possible. Where the likelihood is considered extremely unlikely or the consequences are trivial, and no further prevention or mitigation action is to be taken, then this is to be justified; and
- (c) is planned for (e.g. emergency actions cover such a situation, maintenance is undertaken to prevent it).

They should be identified by:

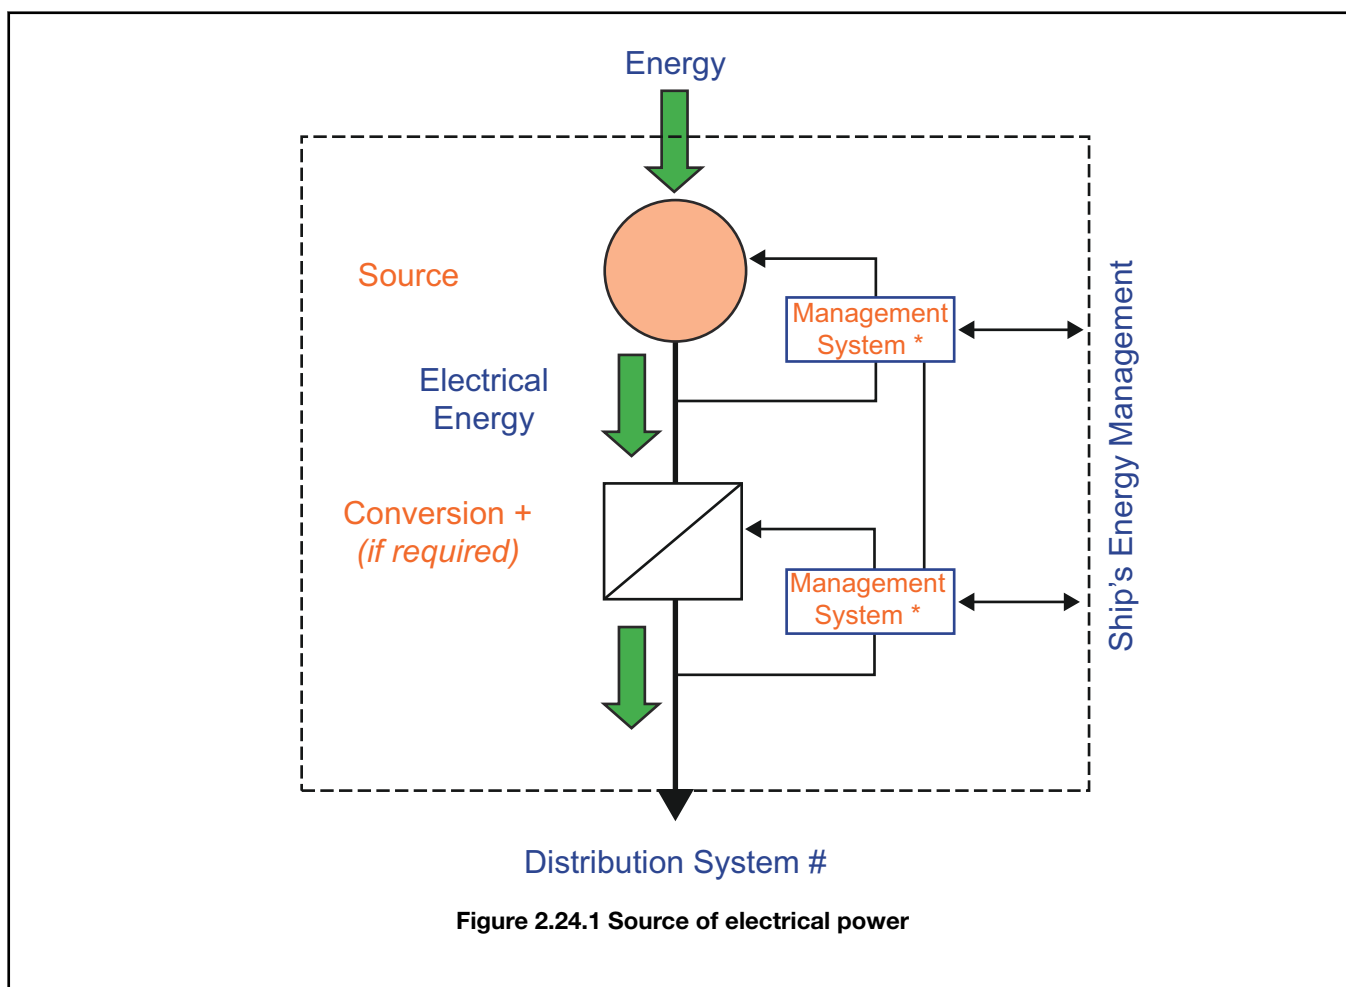

- (a) using analysis processes that are capable of revealing abnormal conditions;
- (b) employing a mix of personnel including designers, Operators, persons who carry out maintenance and competent safety/risk professionals with relevant domain knowledge and understanding to apply the processes;
- (c) referencing relevant events and historic data; and
- (d) documenting the results of the analysis.

24.3.3 Source of electrical power: A source of electrical power produces electrical power from an energy source such that its output may be connected to ship's electrical power distribution system (see Figure 2.24.1 Source of electrical power). It includes:

- (a) Dedicated conversion where conversion is the changing of an output with respect to its input and may include change of form (e.g. a.c. to d.c. or d.c. to a.c.), change in magnitude (e.g. of voltage, current or frequency), change in phase or change in reference (e.g. through galvanic isolation);
- (b) Management systems perform monitoring, control, protection and safety functions that are likely to be connected to higher level ship wide supervisory systems: and
- (c) Systems providing control, alarm, monitoring and safety functions such as control panel, governor, automatic voltage regulator (AVR) and emergency shutdown (ESD) system for a reciprocating engine or gas turbine generator.

This definition of source of electrical power is independent of:

- (a) the type of source (e.g. rotating generator, waste heat recovery system, wind generator, solar panel, fuel cell, photovoltaic array);
- (b) the type of distribution system (see Pt 6, Ch 2, 24.3 Definitions 24.3.8); and
- (c) the application of the source (e.g. main/additional/emergency/transitional source of power).

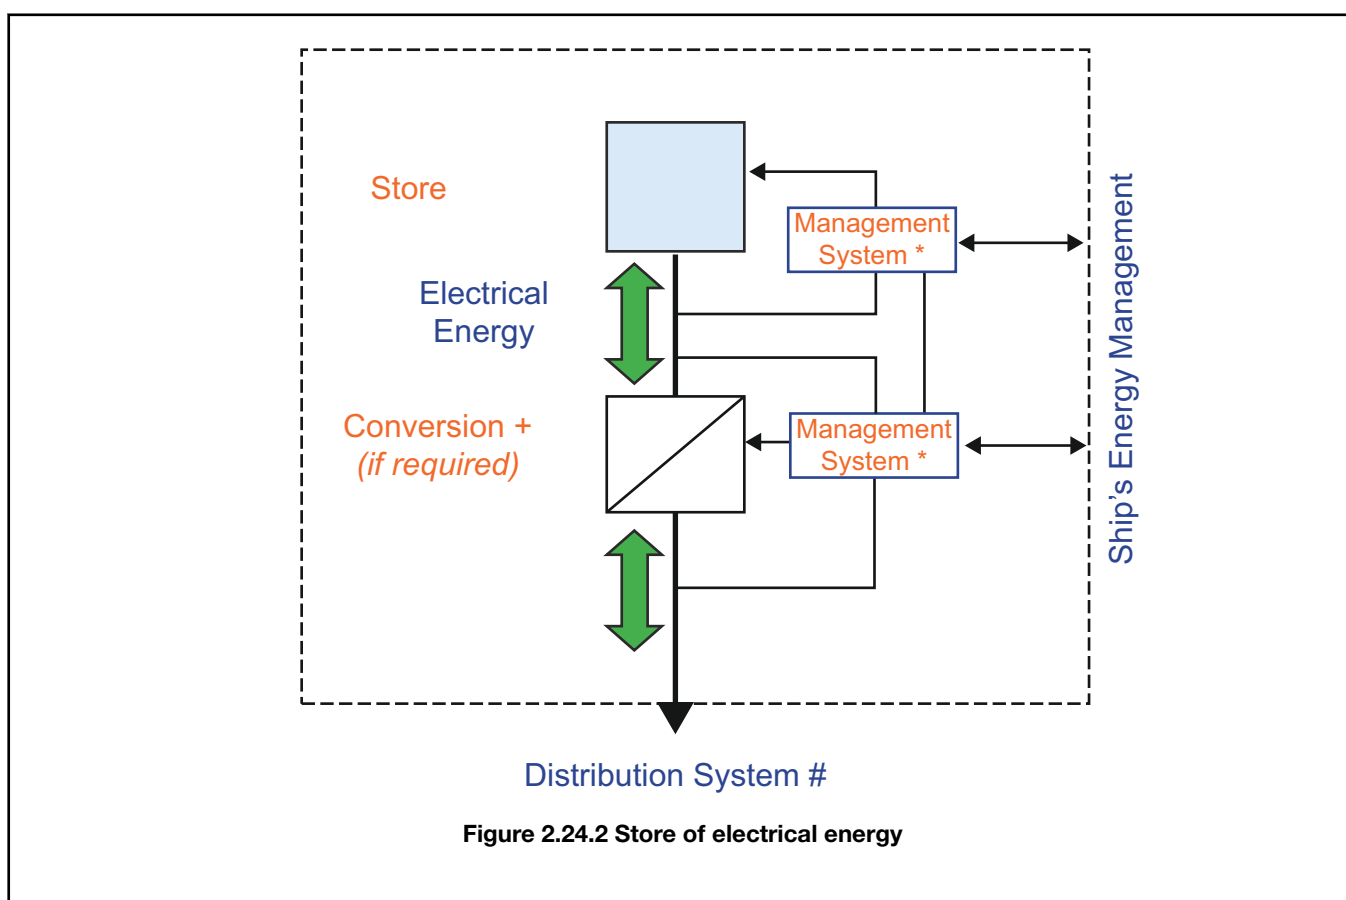

24.3.4 Additional source of electrical power: An additional source of power is a source of electrical power not forming part of the ship's main source of power that is rated to supply a proportion of the ship's main power demand at any time either

continuously or for an accepted period of time, e.g. an energy storage device or a power take-off that is not rated for or capable of permanent operation.

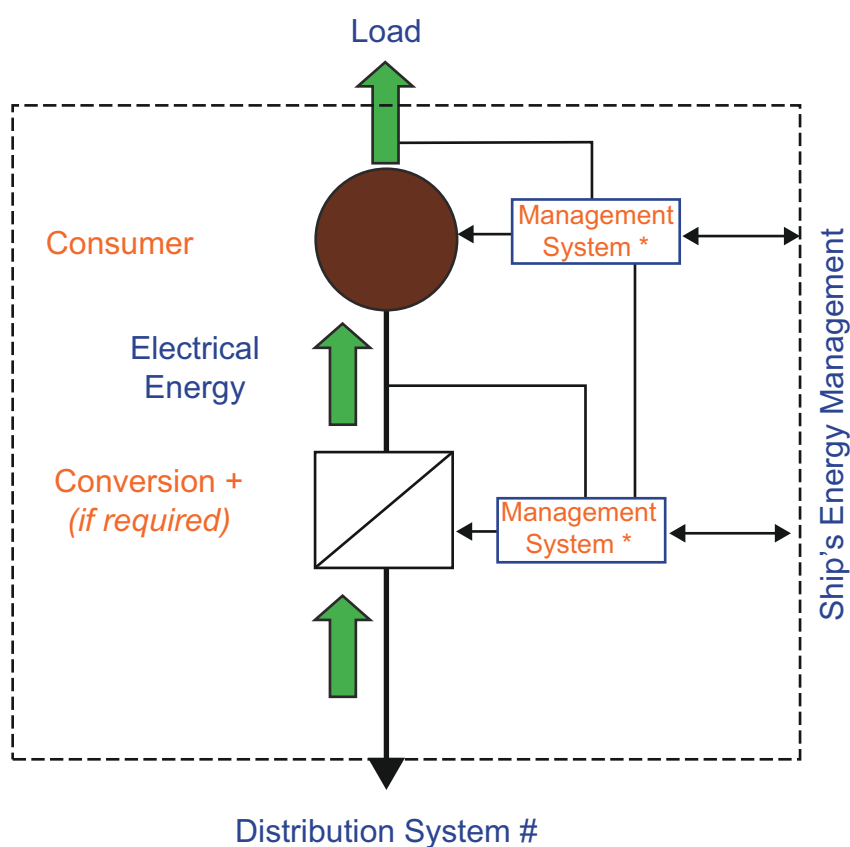

24.3.5 Store of electrical energy: A store of electrical energy receives, stores and discharges energy through a single point of common coupling with the distribution system (see in *Figure 2.24.2 Store of electrical energy*). It includes management systems and any required dedicated conversion as defined in *Pt 6, Ch 2, 24.3 Definitions 24.3.3*. This definition is independent of:

- (a) the method of energy storage;
- (b) the type of store (e.g. battery, capacitor);
- (c) the type of distribution system (see *Pt 6, Ch 2, 24.3 Definitions 24.3.8*); and
- (d) the application of the store (e.g. power source, load smoothing, peak shaving, dynamic response, power backup).

24.3.6 Consumer of electrical power: A consumer of electrical power takes its input from the distribution system and delivers useful work through its associated load (see *Figure 2.24.3 Consumer of electrical power*). It includes management systems and any required dedicated conversion as defined in *Pt 6, Ch 2, 24.3 Definitions 24.3.3*. Consumers are present in any electrical power system and are not unique to hybrid electrical power systems. The definition is provided here for completeness. This definition is independent of:

- (a) the type of load or the purpose for which it is installed; and
- (b) the type or physical form of distribution system.

**Figure 2.24.3 Consumer of electrical power**

24.3.7 Combined sources/stores/consumers of electrical power: A combined source/store/consumer of electrical power provides multiple functions as defined in Pt 6, Ch 2, 24.3 Definitions 24.3.4 to Pt 6, Ch 2, 24.3 Definitions 24.3.7 in a single functional arrangement (some examples are shown in Figure 2.24.4 Combined source and consumer of electrical power to Figure 2.24.7 Combined store of electrical energy and source and consumer of electrical power). They include management systems and any required dedicated conversion as defined in Pt 6, Ch 2, 24.3 Definitions 24.3.3.

Figure 2.24.4 Combined source and consumer of electrical power to Figure 2.24.7 Combined store of electrical energy and source and consumer of electrical power depict building blocks that may be encountered in a hybrid electrical power system. These do not represent complete systems, are provided for illustration purposes only and are not exhaustive with further permutations being viable.

Figure 2.24.4 Combined source and consumer of electrical power

Figure 2.24.5 Combined source of electrical power and store of electrical energy

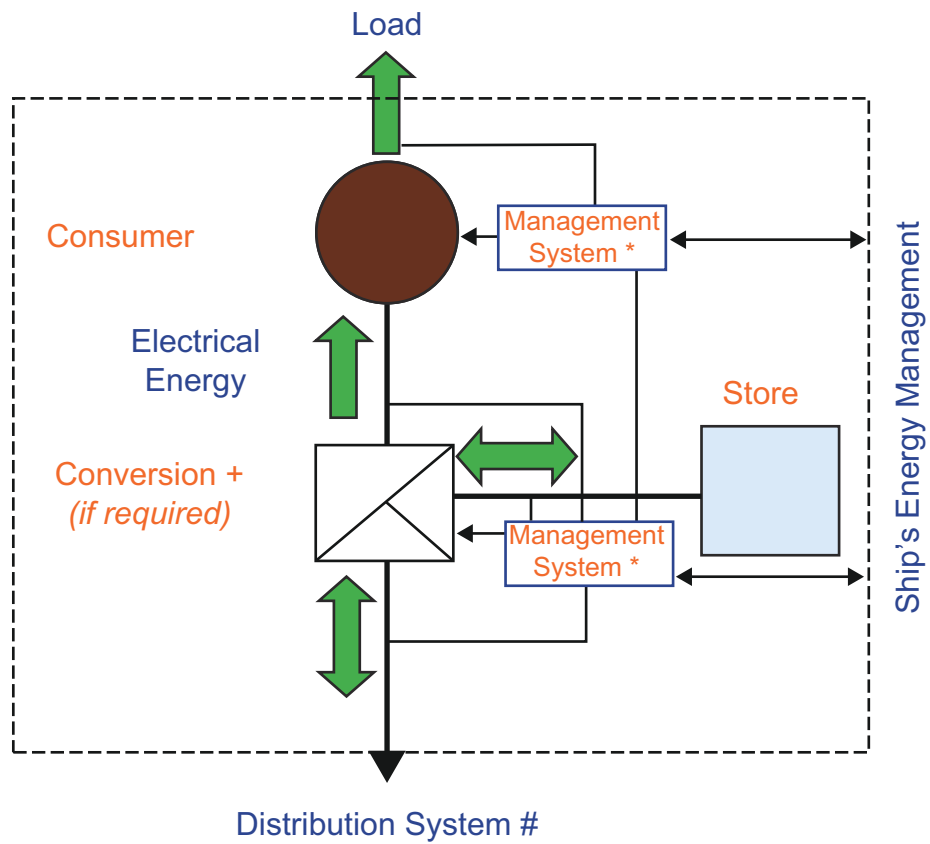

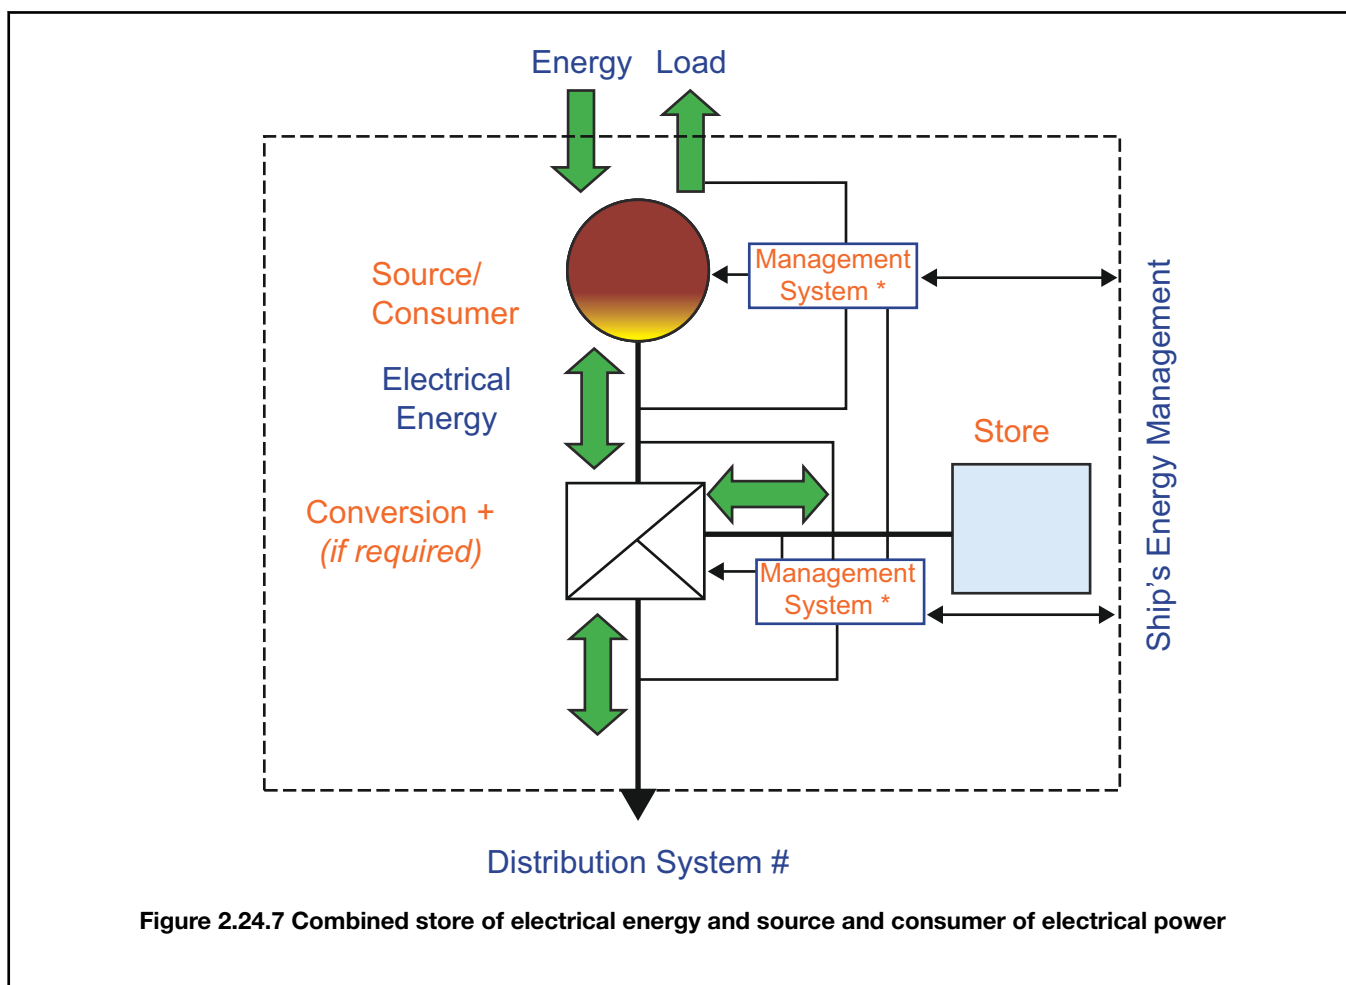

Figure 2.24.6 Combined store of electrical energy and consumer of electrical power

24.3.8 Distribution system: The distribution system provides the interconnection between, protection of and isolation of:

- sources (see Pt 6, Ch 2, 24.3 Definitions 24.3.3 to Pt 6, Ch 2, 24.3 Definitions 24.3.4),
- stores (see Pt 6, Ch 2, 24.3 Definitions 24.3.5),
- consumers (see Pt 6, Ch 2, 24.3 Definitions 24.3.7) and
- combinations thereof (see Pt 6, Ch 2, 24.3 Definitions 24.3.7).

It includes management systems (e.g. power management) and any required dedicated conversion as described in Pt 6, Ch 2, 24.3 Definitions 24.3.3. There are no constraints on its type (e.g. a.c. or d.c.), magnitude (e.g. voltage and/or frequency), nature (e.g. fixed or variable), architecture (e.g. tree, radial, zonal), physical form or on the number of variants within a ship.

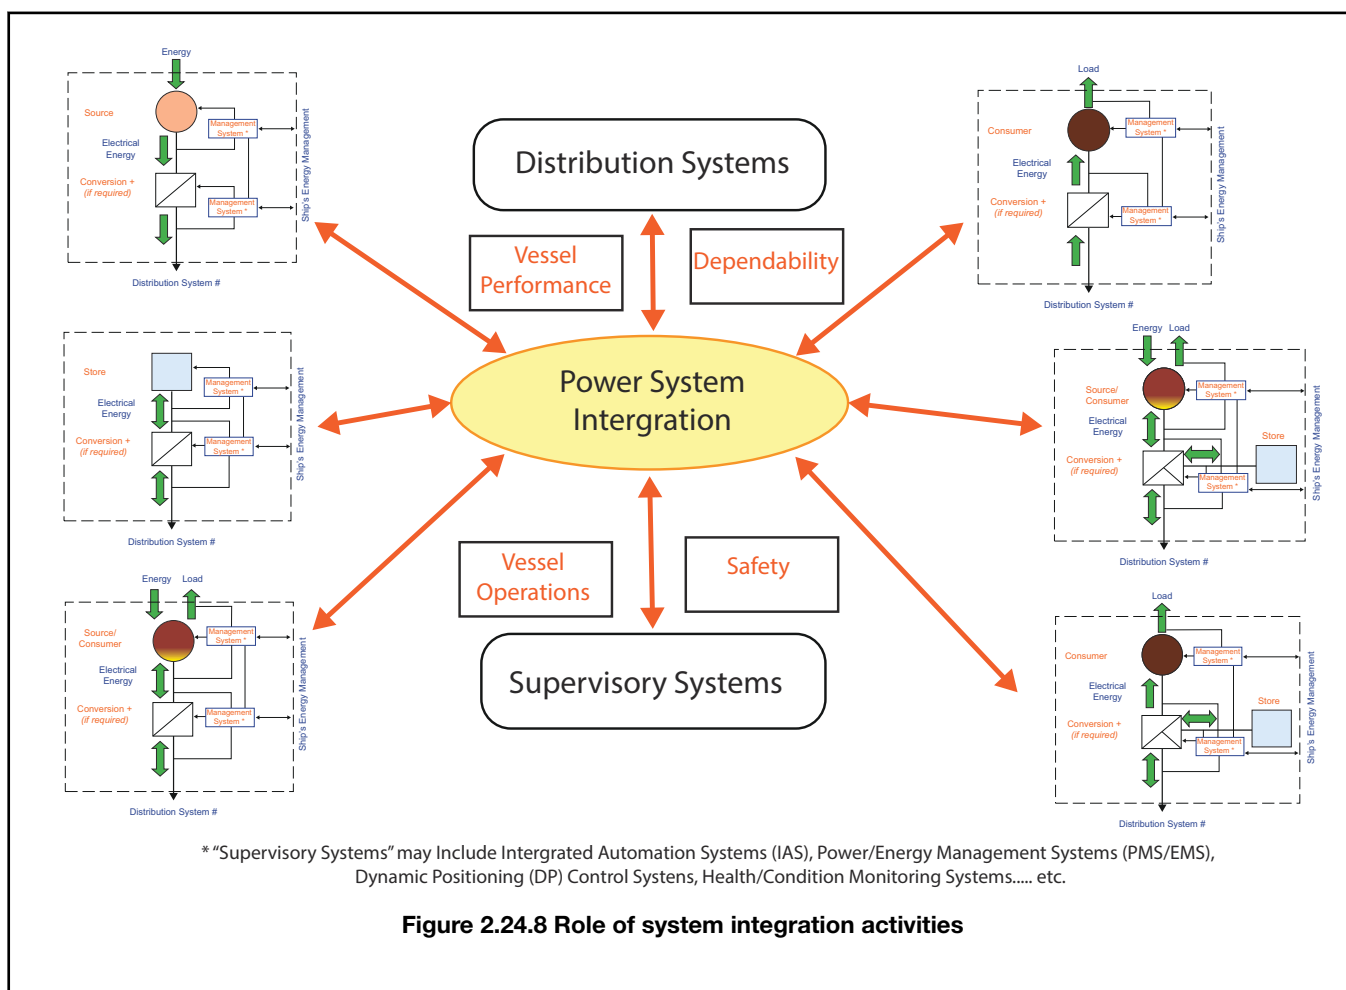

24.3.9 Energy management: Energy management functionality provides the overall control, monitoring, protection and safety functions that are necessary to deliver dependable electrical power from the hybrid electrical power system in all operating modes and under both normal and reasonably foreseeable abnormal conditions. It comprises supervisory functions that integrate the management systems of the components (sources, stores, consumers, distribution systems) from which the hybrid system is constructed and may be implemented as a stand-alone system or as distributed functionality across a number of systems.

Energy management is focused on energy flow and is typically model based, predictive in nature, inclusive of optimisation functionality and employing the principles of health and condition monitoring at system level (e.g. as described in *ShipRight Procedure for the Approval of Digital Health Management Systems*).

Energy management functionality is considered additional to the functionality of a conventional power management system as described in IEC 60092-504, *Electrical installations in ships, Part 504: Automation, control and instrumentation*, Section 9.4.

24.3.10 Power system integration: Power system integration comprises those system level activities that are required to be undertaken to design and develop, build and then operate and maintain safely through life a dependable ship's hybrid electrical power system including its constituent components (shown pictorially in Figure 2.24.8 *Role of system integration activities*). At

each phase of a project power system integration is managed by a single designated party and is carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements for all parties involved.

24.3.11 Dependability: Dependability is as defined in IEC 60050(191), *Quality vocabulary – Part 3: Availability, reliability and maintainability terms – Section 3.2: Glossary of international terms*. It is the collective term used to describe the availability performance and its influencing factors: reliability performance, maintainability performance and maintenance support performance as agreed with LR.

24.4 Hybrid electrical power system performance - System functional requirements

24.4.1 To provide sufficient electrical power of appropriate dependability to supply the required essential services, habitability requirements and those services required to maintain the ship in a normal sea-going and operational state during defined operational conditions without recourse to the emergency electrical supply.

24.4.2 Damage and injury: To provide electrical systems and equipment with suitable protection under fault conditions to prevent the following:

- (a) injury to onboard personnel;
- (b) damage to the equipment itself; and
- (c) damage to equipment connected to it.

24.4.3 On ships with electric propulsion, to provide sufficient electrical power necessary for an effective and agreed level of propulsion power during all normal and reasonably foreseeable abnormal operational conditions.

24.5 Hybrid electrical power system performance - System performance targets

24.5.1 For **Hybrid Power** notation the performance of the system is to be such that in the event of a single failure operation of the system may be interrupted but is to be recoverable to a defined state bounded by time and magnitude.

24.5.2 For **Hybrid Power (+)** notation the performance of the system is to be such that in the event of a single failure operation of the system is to be uninterrupted with any degradation of performance agreed between the designers and Owners.

24.5.3 The hybrid electrical power system performance targets in all modes of operation are to be defined and agreed between the designers and Owners.

24.5.4 The electrical system design maximum and minimum operating voltage and input frequency together with acceptable limits of excursions are to be specified by the system designer and are to be in compliance with the requirements of the Rules.

24.5.5 Specific consideration is to be given to time-based performance targets for systems in which stored electrical energy supplies any part of the ship's main power demand.

24.5.6 Methods of verification of actual performance against targets are to be defined and are to cover all phases of the lifecycle.

24.6 Hybrid electrical power system performance - Dependability principles

24.6.1 The hybrid electrical power system dependability principles are to be defined and agreed between the designers and Owners consistent with the requirements for **Hybrid Power** or **Hybrid Power (+)** notation.

24.6.2 The principles are to cover defined operating modes, all normal and reasonably foreseeable abnormal operating and fault conditions and are to specifically consider the fault ride-through capability of the system.

24.6.3 The principles are to cover failures in active components of any of the sources, stores, consumers, distribution system and energy management forming the hybrid electrical power system. Such components may include, but are not restricted to, the following:

- (a) Prime movers (e.g. auxiliary engines);
- (b) Generators and their excitation equipment;
- (c) Gearing;
- (d) Pumps;
- (e) Fans;
- (f) Switchgear and controlgear, including their assemblies;
- (g) Thrusters; and
- (h) Valves (where power actuated).

24.6.4 Consideration is to be given to other enabling systems not part of the hybrid electrical power system whose failure or degradation could affect correct functioning of the hybrid electrical power system (e.g. lubrication, cooling and ventilation systems).

24.6.5 The continuity of supply to essential and emergency safety systems is to be maintained, in accordance with *Pt 6, Ch 2, 2 Main source of electrical power*.

24.6.6 Arrangements are to ensure that the supply of essential services is not disrupted by the unavailability of the largest source of electrical power and are to be in accordance with a clearly described, documented and agreed redundancy design intent.

24.6.7 The size and rating of electrical energy stores is to be appropriate for the specified lifetime when subjected to in-service cyclic loading. Calculations supporting this assessment are to be provided to LR.

24.6.8 For **Hybrid Power (+)** a hybrid electrical power system dependability assessment is to be undertaken and submitted to LR. The objectives of the assessment are to:

- demonstrate the dependability of the system during all normal and reasonably foreseeable abnormal conditions; and
- demonstrate that an appropriate level of dependability is achieved that is commensurate with that agreed between the designers and Owners.

The assessment shall be undertaken to a recognised standard that is acceptable to LR (e.g. IEC 60300-3-1, *Dependability management Part 3-1: Application guide – Analysis techniques for dependability – Guide on methodology*).

24.7 Hybrid electrical power system performance - Main source of electrical power

24.7.1 The main source of electrical power is to comply with the requirements of *Pt 6, Ch 2, 2 Main source of electrical power*.

24.7.2 Any type of source of electrical power as detailed in these hybrid electrical power system Rules may, subject to the approval of LR, be considered as having equivalent function to that of a generating set as described in, but not limited to, *Pt 6, Ch 2, 2 Main source of electrical power*.

24.7.3 Sources of electrical power not forming part of the ship's main source of electrical power may be used as an additional source of electrical power to supply electrical services required for normal operational and habitable conditions provided that:

- (a) The quality of power supplies meets the requirements of *Pt 6, Ch 2, 24.17 Transversal requirements 24.17.3*; and
- (b) Automatic arrangements are provided to start and connect within a period not exceeding 45 seconds one of the sources forming the main source of electrical power in the event of a single failure or the quality of power supplies exceeding limits.

24.8 Hybrid electrical power system performance - Emergency source of electrical power

24.8.1 The emergency source of electrical power is to comply with the requirements of *Pt 6, Ch 2, 3 Emergency source of electrical power*.

24.8.2 For ships with a specified service notation as defined in *Pt 1, Ch 2, 2.3 Class notations (hull)*, where it is proposed that a dedicated emergency source of electrical power and its associated transitional source of power will not be provided, the main source of electrical power and associated equipment is to meet the following requirements:

- (a) Sources providing the main source of electrical power are to be:
 - (i) separated and located in two or more compartments that are not contiguous with each other;
 - (ii) self-contained and arranged to be independent such that each system can operate without recourse to the other main source(s) including power distribution and any associated auxiliary and ancillary converting equipment and control systems;
 - (iii) arranged such that a fire, flood or casualty in any one of the compartments will not affect the electrical power distribution from the other(s), or to the services required by *Pt 6, Ch 2, 3 Emergency source of electrical power*;
 - (iv) capable of being started automatically on loss of the power supplied by the other main source(s) of electrical power and supplying the essential services as quickly as is safe and practicable subject to a maximum of 45 seconds, or provided with a transitional source of emergency electrical power;
 - (v) arranged to allow for maintenance at sea of any one source without affecting the ability to comply with these requirements; and
 - (vi) provided with starting arrangements compliant with the requirements of *Pt 5, Ch 2, 9.5 Starting of the emergency source of power*.
- (b) Where these Rules specify that a service is required to be connected to both the main and emergency source of electrical power or is to be connected to the emergency switchboard, then these services are to be served by at least two individual circuits from the separated main sources of electrical power with arrangements to transfer between the two sources. The supplies are to be separated in their switchboard and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies so that any single fault will not cause the loss of both supplies.
- (c) Provision is to be made for periodic testing to demonstrate services required by *Pt 6, Ch 2, 3 Emergency source of electrical power* can be supplied automatically following the loss of one main source of electrical power.
- (d) To demonstrate compliance with these requirements a risk assessment of the electrical, mechanical, piping arrangements, cooling arrangements and any other sub-systems whose failure or degradation could have an impact on the performance of the system is to be carried out demonstrating that a single point failure such as a fire or flooding within a space would not render the systems incapable of supplying those services required in an emergency or other reasonably foreseeable abnormal event. The assessment is to be undertaken to a recognised standard that is acceptable to LR (e.g. ISO 31010, *Risk management – Risk assessment techniques*) and in accordance with *ShipRight Procedure Assessment of Risk Based Designs and associated annexes*.

24.9 Hybrid electrical power system performance - External source of electrical power

24.9.1 Ships utilising an external source of power are to comply with the requirements of *Pt 6, Ch 2, 4 External source of electrical power*.

24.9.2 Arrangements for d.c. external sources are to comply with a recognised standard that is acceptable to LR.

24.9.3 Onshore power supplies and their connection are to comply with *Pt 7, Ch 13 On-shore Power Supplies*.

24.9.4 Ships using an external source of power to charge onboard stores of electrical energy will be specifically considered by LR. Details of the arrangements and their interfaces to ship systems are to be submitted.

24.10 Hybrid electrical power system performance - Electrical power supply to ship propulsion and ship positioning systems

24.10.1 Ships with electric propulsion are to comply with the relevant power requirements of *Pt 6, Ch 2, 16.3 Power requirements*.

24.10.2 Ships with electrically driven azimuthing thrusters are to comply with the relevant power requirements of *Pt 5, Ch 20, 5.2 Generating arrangements 5.2.2*.

24.10.3 Ships with dynamic positioning systems are to comply with the relevant power requirements of *Pt 7, Ch 4 Dynamic Positioning Systems*.

24.10.4 Passenger ships are to comply with the relevant power requirements of *Pt 5, Ch 23 Additional Requirements for Passenger Ships* and the *ShipRight Procedure for Assigning the SRtP Descriptive Note*.

24.10.5 Ships with optional notations for propulsion and steering redundancy are to comply with the relevant power requirements of *Pt 5, Ch 22, 3.3 Electrical power supply*.

24.10.6 Ships with the optional notation for integrated propulsion systems are to comply with the relevant power requirements of *Pt 5, Ch 18, 2 Machinery arrangements*.

24.11 Hybrid electrical power system components - Source of electrical power

24.11.1 The main source of electrical power is to comply with the requirements of *Pt 6, Ch 2, 2 Main source of electrical power*.

24.11.2 The emergency source of electrical power is to comply with the requirements of *Pt 6, Ch 2, 3 Emergency source of electrical power*.

24.11.3 External sources of electrical power are to comply with the requirements of *Pt 6, Ch 2, 4 External source of electrical power*.

24.11.4 Additional sources of electrical power as defined in *Pt 6, Ch 2, 24.3 Definitions 24.3.4* are to comply with the requirements of this Chapter.

24.11.5 Rotating electrical generators within sources of electrical power are to comply with the requirements of *Pt 6, Ch 2, 9 Rotating machines*.

24.11.6 Converters within power sources are to comply with *Pt 6, Ch 2, 10.2 Semiconductor converters* and the following requirements:

- (a) Converters are to be selected to withstand the voltage ripple levels present on the distribution system. For every system, the following voltage parameters are to be defined:
 - (i) maximum non-repetitive peak;
 - (ii) maximum repetitive peak; and
 - (iii) maximum repetitive peak-to-peak.
- (b) Where pulse width modulation converters are to be used, the voltage rate of rise times are to be determined, the results recorded and submitted to LR. Rotating machinery, surge protective devices, cable insulation and motor windings are to be designed accordingly.
- (c) Converters may be of conversion type a.c./a.c., d.c./a.c., a.c./d.c., d.c./d.c., and of the controlled (e.g. active front end (AFE)) or non-controlled type (e.g. diode supply unit (DSU)).
- (d) Converters are to be provided with visual status indication at their associated control stations to include, but not be limited to:
 - (i) Power available at the input;
 - (ii) Power at output;
 - (iii) Temperature; and
 - (iv) Overload.

If certain indicators and alerts are not applicable, sufficient evidence to support the claim is to be submitted for consideration by LR. Additional indicators, alerts and shutdowns may be necessary as determined through the system Failure Modes and

Effects Analysis (FMEA) required by *Pt 6, Ch 2, 24.27 Power system development and integration - System Failure Modes and Effects Analysis (FMEA)*.

- (e) Converters supplying electrical power to the distribution system and consumers are to be capable of delivering the required currents for the time required to enable current-time discrimination of protective devices to operate. The electrical output of the converter is to be automatically restored following fault clearance.
- (f) Converter software is to satisfy the requirements of *Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems*
- (g) Converters are to be capable of handling voltage and current spikes from the distribution system under all normal and reasonably foreseeable abnormal conditions without sustaining any damage or tripping.
- (h) Converters supplying essential services are to automatically restart and connect to the distribution system after a blackout as specified in *Pt 6, Ch 2, 2.2 Number and rating of generators and converting equipment*.
- (i) Where converters are equipped with internal capacitors which can contribute significantly to the short-circuit level of the system, the contribution is to be included in the design of the protection and distribution system.
- (j) The risk of converter component damage due to inrush currents is to be minimised by appropriate management of these currents during transient events and after short circuit.
- (k) Where capacitors are connected to a converter output, the output is to be charged by the converter or by external chargers to a level which will minimise the risk of damage to the capacitors before connecting them to the distribution system.
- (l) Converters arranged to operate in parallel are to be capable of stable load sharing up to maximum continuous load and inclusive of any temporary overloads within their design rating.
- (m) Where converters are arranged to provide protection against electrical faults a disconnect or switch disconnect is to be provided to enable safe isolation of the converter from its incoming supplies.
- (n) Converters are to be protected from permanent physical damage as a result of short circuits or overload currents on their input and output terminals.
- (o) Converters are to have a ride-through capability to manage system transients including the effects of fault clearance in the distribution system that is consistent with the dependability requirements of the system.
- (p) Converters are to be provided with appropriate filters to ensure the required quality of power supply at both their input and output. In the event of filter circuit failure, continued safe operation of the hybrid electrical power system is to be possible by following specified procedures as described in operation procedures. These procedures are to include any operational limitations, and they are to be kept on board, maintained in accordance with *Pt 6, Ch 2, 24.18 Power system development and integration - General 24.18.3* and made available to the Surveyor on request.

24.12 Hybrid electrical power system components - Store of electrical energy

24.12.1 Functional requirements: To provide sufficient stored electrical energy as a component of the main source of power to supply services during normal and reasonably foreseeable abnormal and emergency conditions.

24.12.2 Batteries of the vented and valve-regulated sealed type and lithium batteries are to comply with *Pt 6, Ch 2, 12 Batteries*.

24.12.3 Power converters within stores of electrical energy as illustrated in *Pt 6, Ch 2, 24.3 Definitions 24.3.5* are to comply with the relevant requirements of *Pt 6, Ch 2, 24.11 Hybrid electrical power system components - Source of electrical power 24.11.6*.

24.12.4 For consideration as a component of the main source of power on a ship with a specified service notation as defined in *Pt 1, Ch 2, 2.3 Class notations (hull)* and subject to approval of the National Administration a store of electrical energy is to:

- (a) Comply with *Pt 6, Ch 2, 24.7 Hybrid electrical power system performance - Main source of electrical power*;
- (b) Have a minimum capacity at any stage of its lifecycle sufficient for its contribution to the main source of power that is necessary to achieve the specified service requirements;
- (c) Be provided via energy management functionality with remote indication of state of charge (available capacity in a store expressed as a percentage of rated capacity) and state of health (general condition of a store expressed as a percentage of its ability to deliver the specified performance compared with that of a new store);
- (d) Have a primary purpose of supplying the ship's main power demand. Details of any secondary purpose including but not limited to optimising performance (e.g. load smoothing, peak shaving), improving stability (e.g. dynamic response) or providing transitional power are to be provided to LR; and
- (e) Be capable of being restored from a dead-ship condition with no dependence on other systems or electrical supplies. Details of alternative arrangements may be submitted for consideration by LR.

24.12.5 For consideration as an additional source of power a store of electrical energy is to:

- (a) Comply with *Pt 6, Ch 2, 24.7 Hybrid electrical power system performance - Main source of electrical power 24.7.3*;

- (b) Be provided via energy management functionality with remote indication of state of charge (available capacity in a store expressed as a percentage of rated capacity) and state of health (general condition of a store expressed as a percentage of its ability to deliver the specified performance compared with that of a new store); and
- (c) Have a primary purpose of supplying the ship's main power demand. Details of any secondary purpose including but not limited to optimising performance (e.g. load smoothing, peak shaving), improving stability (e.g. dynamic response) or providing transitional power are to be provided to LR.

24.12.6 For application as an emergency source of power a store of electrical energy is to comply with *Pt 6, Ch 2, 24.8 Hybrid electrical power system performance - Emergency source of electrical power*

24.12.7 Electrical energy storage devices connected to and charged by the distribution system are to be protected against the defined effects of electrical faults in the system.

24.12.8 Energy stores connected to and charged by the distribution system are to be so located and provided with arrangements allowing for the safe isolation of their terminals and the reduction of voltages to a safe level during maintenance or provided with alternative arrangements providing an equivalent level of safety which will be subject to special consideration.

24.12.9 Energy stores are to be connected to the distribution system by protection devices which include but are not limited to overcurrent and short circuit protection. The protective devices used are to be selective, ensuring faults are not transmitted further, independent of the direction of current flow.

24.13 Hybrid electrical power system components - Consumer of electrical power

24.13.1 Functional requirements: To convert electrical power supplied from the hybrid power generation and distribution system into useful work.

24.13.2 Rotating machines within consumers of electrical power are to comply with the requirements of *Pt 6, Ch 2, 9 Rotating machines*.

24.13.3 Converters within consumers of electrical power are to comply with the relevant requirements of *Pt 6, Ch 2, 24.11 Hybrid electrical power system components - Source of electrical power 24.11.6*.

24.13.4 Where a converter is arranged to step down voltage to provide a lower voltage supply to consumers than that of the power system, then arrangements are to be provided to ensure the lower voltage distribution consumers are not subjected to voltage variations, including fast transients, outside their safe operating regions.

24.13.5 Consumers employing loads characterised by constant power characteristics connected to the distribution system through a converter are to be evaluated with respect to ensuring the stability of the power system as part of the power system analysis detailed in *Pt 6, Ch 2, 24.24 Power system development and integration - Power system analysis*.

24.14 Hybrid electrical power system components - Combined sources of electrical power, stores of electrical energy and consumers of electrical power

24.14.1 Functional requirements: To provide the combined functional requirements of each of the elements (sources, stores, consumers) from which the combination is constructed.

24.14.2 Where a single functional or physical assembly contains a combination of source, store or consume functions, then it is to comply with the requirements of each applicable function as detailed in *Pt 6, Ch 2, 24.11 Hybrid electrical power system components - Source of electrical power* to *Pt 6, Ch 2, 24.13 Hybrid electrical power system components - Consumer of electrical power*.

24.15 Hybrid electrical power system components - Distribution system

24.15.1 Functional requirements:

- (a) To provide a dependable interconnection between sources, stores and consumers of electrical power; and
- (b) To distribute electrical power safely to consumers.

24.15.2 Arrangements for isolation and switching are to be provided which are to enable safe isolation of faults and for maintenance.

24.15.3 Distribution systems supplying consumers through converters are to provide galvanic isolation and ground separation.

24.15.4 In addition to the requirements of *Pt 6, Ch 2, 5.3 Isolation and switching*, systems are to comply with the requirements of *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.5* to *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.13*.

24.15.5 Where consumers are supplied via converters which are connected to both sides of a distribution system that is capable of being split, arrangements are to be provided to eliminate the risk of current being supplied back to the distribution system for example through flyback diodes.

24.15.6 Converters connecting sources, stores and consumers connected to the distribution system are to facilitate the connection and removal of sources, stores and consumers in a stable manner with the electrical power system in operation.

24.15.7 Converters are to be designed to prevent damage to the converter when switching under load.

24.15.8 Where essential services are required by *Pt 5 Main and Auxiliary Machinery* to be duplicated, these are to be served by individual circuits, separated in their switchboard or section board and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or controlgear assemblies, so that any single fault will not cause the loss of both services.

24.15.9 The distribution system is to be split into at least two independent systems each capable of independent operation or is to be separated by protection devices that are selective, ensuring faults are not transmitted further, and operate independent of the direction of current flow.

24.15.10 The distribution system is to be protected against electrical faults including short circuit, overload, earth fault, differential current, under/over voltage, under/over frequency, power quality, current and voltage imbalance and arc fault in compliance with the relevant requirements of *Pt 6, Ch 2, 6 System design – Protection* and *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.11 to Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.14*.

24.15.11 Active components may be used for the limitation of fault currents subject to verification in a real environment of the performance of the component under all normal and reasonably foreseeable abnormal operating and fault conditions and subject to establishment of effective surveillance and periodic test procedures during operation and maintenance in the ship's operating manuals to verify the component is capable of performing its intended function. An isolation device is to be provided within the component and this is to be tripped automatically in the event of the component operating. A risk assessment of the component is to be undertaken to a recognised standard that is acceptable to LR (e.g. ISO 31010, *Risk management – Risk assessment techniques*) and in accordance with *ShipRight Procedure Assessment of Risk Based Designs* and associated annexes.

24.15.12 Where energy management functionality provides protection against incorrect or unexpected energy flows between the sources, stores and consumers forming part of the hybrid electrical power system the sensors used for this purpose in the distribution system are to be independent of those used for control, monitoring and safety systems.

24.15.13 Where a bi-directional flow of power may occur, the distribution system is to withstand the power variations being introduced. The level of bi-directional flow allowed is to be specified by the system designer.

24.15.14 For **Hybrid Power (+)** notation facilities are to be provided for automatic detection of the location of insulation breakdown with respect to earth of equipment and distribution systems to a level determined by the integrator consistent with the system's dependability targets and agreed with the designers and Owners.

24.15.15 For either notation, switchgear and controlgear are to comply with the relevant requirements of *Pt 6, Ch 2, 7 Switchgear and controlgear assemblies*.

24.15.16 Power converters within distribution systems are to comply with the relevant requirements of *Pt 6, Ch 2, 24.11 Hybrid electrical power system components - Source of electrical power 24.11.6*.

24.15.17 Where fuses are implemented to limit the fault current in the converter, the activation of the protection is not to influence redundant consumers or cause loss of other single consumers as required by *Pt 6, Ch 2, 5.2 Essential services*.

24.15.18 Fuses used to protect distribution converters are to be of the bolted type. Where alternative arrangements are proposed, it is to be demonstrated that protection system's selectivity is not adversely affected as a result of an increased connection resistance.

24.15.19 For each section of a d.c. bus there is to be at least one voltmeter per section. An ammeter is to be provided for each converter supplying a d.c. bus. Similar arrangements are to be provided for screen-based displays.

24.15.20 The meters required by *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.19* are to be located and arranged such that they may be viewed at a single operating position. In addition, meters may be required at additional locations to mitigate hazards identified by the risk assessment required by *Pt 6, Ch 2, 24.27 Power system development and integration - System Failure Modes and Effects Analysis (FMEA)*.

24.15.21 Power quality assessments are to consider the detection and impacts of circulating currents such as may exist through capacitive coupling in semiconductor converters.

24.15.22 Constant current distribution systems will be subject to special consideration and are not covered by these Rules.

24.15.23 For **Hybrid Power (+)** notation warnings of degrading power quality are to be provided and in the event of power quality exceeding prescribed limits automatic isolation and reconfiguration of the power system is to occur as agreed between the designers and Owners.

24.16 Hybrid electrical power system components - Energy management

24.16.1 Functional requirements:

- (a) To ensure that sufficient energy is available to satisfy the main power demand under all foreseeable operational conditions.
- (b) To inform Operators as soon as reasonably practicable of deviations from normal operation of the hybrid electrical power system under all normal and reasonably foreseeable abnormal operational conditions.
- (c) To initiate immediate corrective action on detection of component faults in the hybrid electrical power system that present a danger, reducing the risk to a level that is acceptable to LR.
- (d) To provide functionality beyond the scope of conventional power management that is necessary for the control, monitoring, protection and dependability of the hybrid electrical power system.

24.16.2 Programmable electronic systems used to provide energy management functionality, or to provide safety functions, are to have arrangements which satisfy the applicable requirements of *Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems*.

24.16.3 Proposed modifications to software, including parameter changes, and during acceptance testing and trials are to be in accordance with *Pt 6, Ch 1, 1.5 Alterations and additions* as applicable.

24.16.4 Loss of energy management functionality is not to compromise the supply of main power, the safety of the ship, the hybrid electrical power system, or its components.

24.16.5 Energy management functionality is to include, but not be limited to, the following:

- (a) Control (of the complete system and of each of its sub-systems):
 - (i) Hybrid electrical power system operating mode selection and transition;
 - (ii) Connection and disconnection of sources, stores and consumers to the distribution system in response to operating conditions and prevailing loads;
 - (iii) Connection and disconnection of distribution system sections;
 - (iv) Load allocation to and sharing between sources;
 - (v) Load restriction of consumers;
 - (vi) Energy flow management;
 - (vii) Distribution system a.c. voltage and frequency and d.c. voltage; and
 - (viii) Control functions required by sources, stores, consumers or distribution system that are necessary for their operation under all reasonably foreseeable normal, abnormal and fault conditions.
- (b) Alarm and monitoring:
 - (i) Mode transition status;
 - (ii) Connection status of sources, stores, consumers and distribution system sections;
 - (iii) Energy flows within the hybrid electrical power system and between its constituent parts;
 - (iv) Power quality as detailed in *Pt 6, Ch 2, 24.17 Transversal requirements 24.17.3*; and
 - (v) For stores, state of charge and state of health as defined in *Pt 6, Ch 2, 24.12 Hybrid electrical power system components - Store of electrical energy 24.12.4* and *Pt 6, Ch 2, 24.12 Hybrid electrical power system components - Store of electrical energy 24.12.5*.
- (c) Protection and safety:
 - (i) Blackout prevention;
 - (ii) Blackout recovery;
 - (iii) Detection of abnormal or unexpected energy flow as described in *Pt 6, Ch 2, 24.15 Hybrid electrical power system components - Distribution system 24.15.13*; and
 - (iv) Safety functions required by sources, stores, consumers or distribution system that are necessary for their safe operation.

24.16.6 Overall ship-wide energy management functionality is to be integrated and coordinated with the functionality of the local management systems as described in *Pt 6, Ch 2, 24.3 Definitions* for each of the components (sources, stores, consumers, combinations, distribution system) of the hybrid electrical power system and is to ensure safe operation of the ship under all normal and reasonably foreseeable abnormal operating and fault conditions.

24.16.7 Additional energy management functionality for **Hybrid Power (+)** notation is to consider, but not be limited to, the following. The level of functionality supplied is to be consistent with the enhanced performance and dependability required by the system.

- (a) Control (of the complete system and of each divisible element):
 - (i) Automatic configuration of the power system based on predicted energy flow;
 - (ii) Automatic system isolation and reconfiguration such that, in the event of a single failure in electrical power sources, stores, distribution system or associated control systems, the impact on the operational performance of the ship is as agreed with LR and there is no impact on the ship's ability to complete its mission;
 - (iii) System performance optimisation, independent of primary control functions covering emissions, efficiency, availability, reliability or operating cost; and
 - (iv) Control of stores with load smoothing, peak shaving, dynamic response or other optimisation capability.
- (b) Alarm and monitoring:
 - (i) Degradation of power quality;
 - (ii) Remaining time for continued operation of the power system at current operating conditions and levels of power consumption. This may take the form of a real-time performance capability plot;
 - (iii) System performance covering energy consumption, emissions, efficiency, availability, reliability or operating cost; and
 - (iv) Health and condition of hybrid electrical power system components including the effects of ageing on electrical energy storage devices.
- (c) Protection and safety:
 - (i) Automatic isolation and reconfiguration of the power system on detection of abnormal energy flow;
 - (ii) Consequence analysis determining the remaining time for continued operation of the power system under stated operating and load conditions following the most significant single failure. This may take the form of an onboard off-line simulation derived from, or an integral element of, the simulation described in *Pt 6, Ch 2, 24.23 Power system development and integration - Energy flows 24.23.3*; and
 - (iii) Automatic detection of faults detailed in the system level FMEA with display of mitigating actions.

24.16.8 A description of functionality including also any functions not described in *Pt 6, Ch 2, 24.16 Hybrid electrical power system components - Energy management 24.16.5* and *Pt 6, Ch 2, 24.16 Hybrid electrical power system components - Energy management 24.16.7* is to be submitted.

24.17 Transversal requirements

24.17.1 All electrical equipment is to prevent injury to personnel or damage to other equipment and is to be suitably protected against damage to itself under normal, reasonably foreseeable abnormal and fault conditions.

24.17.2 The supply of electrical power sufficient for the correct operation of electrical services for essential equipment and habitable conditions is to be maintained:

- (a) during all normal and reasonably foreseeable abnormal operating and fault conditions;
- (b) irrespective of the direction of the propulsion shaft rotation; and
- (c) without any requirement to revert to emergency supplies.

24.17.3 Hybrid electrical power systems are to provide a power quality as required by;

- *Pt 5, Ch 2, 7.3 Auxiliary and emergency engine governors*,
- *Pt 6, Ch 2, 1.8 Quality of power supplies*,
- *Pt 6, Ch 2, 2.4 Prime mover governors* and
- *Pt 6, Ch 2, 9.4 Generator control*

during all normal and reasonably foreseeable abnormal operating and fault conditions.

24.17.4 A.c. and d.c. systems are during all normal and reasonably foreseeable abnormal operating and fault conditions to provide a quality of power as required by a recognised National or International Standard specified by the power system integrator that is acceptable to LR.

24.17.5 All components of, or connected to, the distribution system are to be designed and validated for operation across the full range of power quality conditions detailed in *Pt 6, Ch 2, 24.17 Transversal requirements 24.17.2 to Pt 6, Ch 2, 24.17 Transversal requirements 24.17.4*.

24.17.6 The key parameters of power quality as determined by the system integrator with agreement of the Owner and as applicable to the type of electrical power system are to be monitored and recorded for each individually operable section of the distribution system. An alarm is to be raised at a monitored operating station in the event of power quality exceeding limits determined by the system integrator in compliance with the power quality requirements of the Rules. A description of the arrangements provided is to be submitted.

24.17.7 For either notation, all electrical equipment is to comply with the requirements of *Pt 6, Ch 2 Electrical Engineering* including:

- (a) General requirements - *Pt 6, Ch 2, 1 General requirements* including fire, electric shock, ignition, radiation and environment;
- (b) Creepage and clearance - *Pt 6, Ch 2, 7.5 Creepage and clearance distances*;
- (c) Arc - *Pt 6, Ch 2, 8 Protection from electric arc hazards within electrical equipment*; and
- (d) Explosive atmospheres - *Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts*.

24.17.8 The choice of materials and components of construction, as well as the design, location and ship installation, are to be made according to the environmental, maintenance and operating conditions in order to maintain the continued function of the equipment during all normal and reasonably foreseeable abnormal conditions and to reduce the risk of:

- injury to onboard personnel;
- damage to the equipment the system is contained within or adjacent equipment and systems;
- damage to adjacent equipment and systems; and
- damage to the ship.

24.17.9 Where applicable, equipment and components are to be selected from the list of LR type approved products satisfying the requirements of *Pt 6, Ch 1, 1.4 Control, alarm and safety equipment* and *Pt 6, Ch 1, 2.13 Programmable electronic systems - Additional requirements for essential services and safety critical systems*.

24.17.10 Electrical equipment is to be used within its designed operating parameters, such as current, voltage, power, charging rate, energy storage, etc. to prevent:

- (a) a hazard occurring; and
- (b) the equipment affecting safety functions.

24.17.11 All electrical equipment supplied from the main and emergency sources of electrical power and electrical equipment for essential and emergency services is to be selected to operate satisfactorily under the variations of voltage and ripple frequencies which may be present in the system.

24.17.12 Cables and busbars are to be selected and installed in accordance with *Pt 6, Ch 2, 11 Electric cables, optical fibre cables and busbar trunking systems (busways)*.

24.17.13 Transformers within the hybrid electrical power system are to comply with the relevant requirements of *Pt 6, Ch 2, 10.1 Transformers*.

24.17.14 Interlocks or an alternative acceptable to LR are to be provided which will prevent access to capacitors until their voltage level has reduced to below the safe extra low voltage level (50 V); this is to ensure safety of personnel during maintenance.

24.18 Power system development and integration - General

24.18.1 The activities specified in *Pt 6, Ch 2, 24.19 Power system development and integration - System operational concept to Pt 6, Ch 2, 24.31 Verification requirements* are to be undertaken to deliver and maintain a safe and dependable hybrid electrical power system throughout its development, detail design, construction, integration, verification and acceptance. Procedures are to be made available detailing how these activities will be maintained during ship operation, maintenance and disposal.

24.18.2 The activities should be based on the principles of the following five levels with measures adopted at each level being, as far as practicable, independent of each other:

- (a) Prevention of abnormal operation and failures through design and high quality in construction, operating rules and normal operating procedures;
- (b) Control of abnormal operation and detection of failures through control, limiting and protection systems, monitoring/surveillance features and abnormal/emergency operating procedures;
- (c) Control of hazards within the system design to protect against escalation to an incident or accident through engineered safety features and emergency operating procedures;
- (d) In support of and coordinated by the Owner and ship designer, control of severe ship or infrastructure conditions that may exceed the system design intent including prevention of hazard progression and mitigation of hazardous consequences through complementary procedures and hazard management; and
- (e) In support of and coordinated by the Owner and ship designer, mitigation of accident consequences through emergency response.

The system designer is to ensure adoption of principles (a) to (c) during the development and integration of the hybrid electrical power system providing evidence to LR through the documentation that is submitted for design review as detailed in *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.18*.

24.18.3 At each phase of a project integration activities are to be managed by a suitably competent single designated party and are to be carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements of all parties involved.

24.18.4 Where the designated party changes during a project, then there is to be a full and auditable transfer of necessary integration information between the parties.

24.18.5 Systems engineering processes are to comply with *ISO 15288 Systems and Software Engineering – System Life Cycle Processes* or an acceptable equivalent National or International Standard.

24.19 Power system development and integration - System operational concept

24.19.1 The system operational concept is to be defined including a description of how the control, alarm and safety systems for the hybrid electrical power system provide effective means for operation and control during all defined ship operational conditions.

24.19.2 The system operational concept is to detail the capability, functionality and modes of operation under defined operating and emergency conditions and is to be agreed between the designers and Owners.

24.19.3 The system operational concept is to be submitted for design review.

24.20 Power system development and integration - Operating modes

24.20.1 Operating modes for the hybrid electrical power system are to be defined and agreed between the designers and Owners.

24.20.2 Modes are to cover all normal and reasonably foreseeable abnormal operating and fault conditions.

24.20.3 Modes are to be compatible with the ship's overall operating modes.

24.20.4 The sequence of transition between operating modes is to be defined for all reasonably foreseeable normal and abnormal operating and fault conditions.

24.20.5 A technical description is to be produced specifying for each of the ship's possible operating modes:

- (a) the type of each electrical power source used to supply the distribution system, such as a.c. generators, d.c. generators, converter, batteries, fuel cells and photovoltaics;
- (b) the operating mode of each electrical power source such as constant voltage, constant current or variable voltage;
- (c) the configuration of the electrical distribution system, including the earthing and protection strategies to be used; and
- (d) the worst-case failure design intent.

24.21 Power system development and integration - Consumer categorisation

24.21.1 Consumers supplied with electrical power from the hybrid electrical power system are to be categorised according to their function and the services that they provide in accordance with the requirements of *Pt 6, Ch 2, 1.6 Definitions*.

24.22 Power system development and integration - System components

24.22.1 The specifications for all components of the hybrid electrical power system (sources, stores, consumers, distribution system, energy management) are to be validated by the system designer for completeness and correctness in respect of the component's integration into the overall power system. Validated specifications are to be submitted to LR.

24.22.2 Details of the following are to be specified:

- (a) Operating modes and the transition between them;
- (b) Control and monitoring functions;
- (c) Mechanical components which might affect the hybrid notation (e.g. cooling units with piping arrangements, pumps, valves, etc.);
- (d) Safety functions;
- (e) Failure modes;
- (f) Isolation;
- (g) Initial and through-life verification of conformance; and
- (h) Human element.

24.23 Power system development and integration - Energy flows

24.23.1 Energy flows within the hybrid electrical power system are to be determined for all operating modes and all normal and reasonably foreseeable abnormal operating and fault conditions.

24.23.2 The impact of transition between modes on energy flow is to be considered.

24.23.3 For **Hybrid Power (+)** notation energy flow is to be modelled by a dynamic simulation that can be exercised under normal, reasonably foreseeable abnormal operating and fault conditions and that is maintained for the life of the ship. This simulation may be deployed on board as described in *Pt 6, Ch 2, 24.16 Hybrid electrical power system components - Energy management 24.16.7* in support of off-line consequence analysis.

24.23.4 Simulation tools are to conform to appropriate National or International Standards relevant to their use and are to have been validated in an equivalent application.

24.23.5 The dynamic simulation is to be verified against the energy flows encountered during the ship's real performance to the extent that this is reasonably practicable.

24.23.6 Proprietary simulation tools not conforming to an appropriate National or International Standard will be subject to special consideration. This consideration will include:

- (a) Pedigree of the underlying modelling platform on which the simulation is built;
- (b) Qualitative assessment of the simulation's functional capabilities and model behaviours;
- (c) Configuration management of the simulation model, its architecture, functional blocks and the parameters on which it is based;
- (d) Prior quantitative assessment of the simulation's performance in a similar application; and
- (e) An engineering justification that the validation and verification of the simulation is sufficient to enable its application in all normal and reasonably foreseeable abnormal operating and fault conditions.

24.24 Power system development and integration - Power system analysis

24.24.1 The hybrid electrical power system is to be analysed for its electrical performance under all defined operating modes and all normal and reasonably foreseeable abnormal operating and fault conditions.

24.24.2 The analysis is to include, but not be limited to:

- (a) Fault levels under short circuit conditions;
- (b) Fault flows under short circuit and overload conditions;
- (c) Protection device operation, discrimination and coordination;
- (d) Quality of power supplies;
- (e) Steady state performance;
- (f) Transient performance;
- (g) Earth fault currents;
- (h) Resonance; and

(i) Common mode and circulating currents.

24.24.3 Information regarding the expected resistance, inductance and capacitance in the system and the installed components is to be provided as part of the analysis study as required by *Pt 6, Ch 2, 1.2 Documentation required for design review*. The values chosen are to be based upon the component tolerances which result in the worst case for each aspect of the analysis and are to be updated with actual values when determined from component, sub-system or system test.

24.24.4 For **Hybrid Power (+)** notation the analysis is to be by a dynamic simulation that can be exercised under all normal, abnormal and fault conditions, that is maintained for the life of the ship and that can be exercised to verify operation of the protection system including:

- (a) Short circuit, single or multiple phases/poles;
- (b) Overload;
- (c) Overcurrent;
- (d) Current imbalance;
- (e) Voltage imbalance;
- (f) Zone protection;
- (g) Arc fault;
- (h) Earth fault;
- (i) Under/over voltage;
- (j) Under/over frequency;
- (k) Harmonic content;
- (l) Quality of power supplies including degradation detection;
- (m) Energy flow including any regeneration by consumers;
- (n) Resonance and stability;
- (o) Transient impact of fault detection, clearance and isolation;
- (p) Transient impact of sources, stores and consumers being tripped or shut down;
- (q) Transient impact of load changes, both increase and decrease; and
- (r) Load sharing imbalance.

24.24.5 Simulation tools are to conform to appropriate National or International Standards relevant to their use and are to have been validated in an equivalent application.

24.24.6 The dynamic simulation is to be verified against the ship's real performance to the extent that this is reasonably practicable.

24.25 Power system development and integration - Safety functions

24.25.1 Safety functions related to the hybrid electrical power system and its constituent parts are to be clearly defined covering their purpose, their functionality and their location.

24.25.2 Safety functions are to comply with *Pt 6, Ch 1, 2 Essential features for control, alarm, monitoring and safety systems*.

24.25.3 Safety functions including ESD, emergency stop and reversionary control procedures for the hybrid electrical power system are to be defined, fully documented and made available to the Operators, maintainers and regulatory authorities.

24.26 Power system development and integration - Risk assessment

24.26.1 Where the hybrid electrical power system introduces new technologies or topologies not covered by the current Rules and Regulations then a risk assessment study is to be carried out.

24.26.2 A formal method acceptable to LR is to be used to determine if new or significantly greater hazards than those normally associated with the ship electrical power system that would be mitigated by compliance with the Rules and Regulations have been introduced (e.g. a preliminary hazard analysis or a structured checklist approach (HAZID) in accordance with ISO 31010, *Risk management – Risk assessment techniques*).

24.26.3 Where the results of this formal method establish that new hazards exist, the risk assessment study is to be undertaken to a recognised standard that is acceptable to LR (e.g. ISO 31010, *Risk management – Risk assessment techniques*) and in accordance with *ShipRight Procedure Assessment of Risk Based Designs* and the associated annexes.

24.26.4 The objectives of the study are to:

- (a) identify potential deviations from the intended operation of the hybrid electrical power system;
- (b) identify the causes of each deviation, and the consequences for safety and dependability;
- (c) list safeguards to minimise causes and consequences; and
- (d) determine and recommend if further safeguards should be considered.

24.26.5 The scope of the study is to consider normal operation, start-up, normal shutdown, non-use and emergency shutdown of the hybrid electrical power system.

24.26.6 The risk assessment technique(s) selected are to be appropriate for their intended use and are to be accepted by LR.

24.27 Power system development and integration - System Failure Modes and Effects Analysis (FMEA)

24.27.1 An overall hybrid electrical power system FMEA is to be undertaken. The objectives of the analysis are to identify:

- (a) potential failures;
- (b) consequences of failure on the hybrid electrical power system and on ship operations;
- (c) means to eliminate or prevent failure; and
- (d) means to eliminate or minimise consequences.

24.27.2 The analysis may identify the requirement for safety measures in addition to those specifically stated in these Rules. Where additional safety measures are identified, evidence is to be provided that demonstrates how they are implemented and validated.

24.27.3 As a minimum, the scope of the analysis is to consider the 'fail safe' condition, location and arrangement of the critical system elements.

24.27.4 The analysis is to be undertaken to a recognised standard (e.g. IEC 60812, *Analysis techniques for system reliability – Procedure for failure mode and effects analysis (FMEA)*), or an equivalent and acceptable National or International Standard.

24.27.5 The FMEA is to consider but not be limited to:

- (a) Hidden faults that are not annunciated to or evident to the Operator where a second subsequent fault can directly result in a significant failure and hazardous condition;
- (b) Foreseeable inadvertent operation of the hybrid electrical power system;
- (c) Failure to complete transition sequences (e.g. change of operating mode or response to a fault including its detection, clearance, isolation and reconfiguration);
- (d) Items which can be dormant failed and unavailable to perform their intended operation on demand (e.g. normal to backup changeover systems or standby start systems);
- (e) Enabling systems not part of the hybrid electrical power system (e.g. fuel supply, lubrication, cooling and ventilation systems) whose failure could affect correct functioning of the hybrid electrical power system;
- (f) Sensor and feedback errors in programmable electronic systems;
- (g) Parameter corruption in programmable electronic systems (e.g. incorrect scaling factors, control rates, alarm thresholds or trip levels);
- (h) Common cause effects in programmable electronic systems (e.g. network storms in networked systems, power supply faults, time dependent errors in operating systems with the potential to concurrently impact multiple redundant control or monitoring systems);
- (i) Common cause effects in electrical power systems (e.g. power quality outside expected range or multiple earth faults in a parallel connected system);
- (j) Consequential failures resulting from a single failure that are to be considered as an integral part of the single failure; and
- (k) The viability of the role of the human in the detection and mitigation of faults.

24.27.6 Examples of devices in which hidden failures can occur that are detrimental to the dependability of a hybrid electrical power system include but are not limited to:

- (a) Protection devices – protection relays, dead-bus sensing;
- (b) Automatic isolation devices;
- (c) Circuit breaker open/close/trip functions;
- (d) Fault/current limitation devices;
- (e) Arc detection;
- (f) Load shedding devices;

- (g) Safety devices;
- (h) Fault detection systems;
- (i) Alternator current boost systems;
- (j) Interlocks and inter-trips;
- (k) Automatic change-over systems, transfer and dual-feed arrangements;
- (l) Stand-by start arrangements;
- (m) Transducers/sensors – giving an incorrect output;
- (n) Slow processors (e.g. watchdog functions);
- (o) UPS backed-up supplies; and
- (p) Active failures of control systems – working but not doing what was intended,

24.27.7 Hybrid electrical power system failure modes identified through the FMEA that could impact the safe operation and performance of any component of the system (source/store/consumer/combination/distribution system/energy management) are to be notified to, and acknowledged by, the party accountable for the safety of the component through an auditable process.

24.27.8 Component failure modes that could impact the safe operation and performance of the hybrid electrical power system are to be notified to, and acknowledged by, the hybrid electrical power system integrator through an auditable process.

24.27.9 For **Hybrid Power (+)** notation FMEAs for each of the key components of the system may be requested by LR in support of the system FMEA.

24.28 Power system development and integration - Operating instructions

24.28.1 Operating Manuals are to be provided on board and submitted for information where requested by LR. The manuals are to include, but not be limited to, the following information:

- (a) Particulars and a description of the systems;
- (b) Operating instructions for the equipment and systems (including fire isolation aspects);
- (c) Maintenance instructions for the installed arrangements, including procedures to prevent injury from electric shock and arc flash;
- (d) Software configuration management procedures which are to include a list of all versions of the software installed in the system, and the settings, values of system or equipment specific configuration parameters; and
- (e) Output from the risk assessment processes that is necessary for the safe operation of the system under all normal and reasonably foreseeable abnormal operating conditions.

24.28.2 Overall hybrid electrical power system operating instructions are to be verified by the system designer for their completeness and correctness in all operating modes and for all foreseeable normal and abnormal operating and fault conditions. The verified instructions are to be submitted to LR.

24.28.3 Consistency between the overall system instructions and those for each component of the system is to be confirmed by the system designer.

24.28.4 All mitigating actions arising from the FMEA that require manual intervention are to be confirmed as included in the operating instructions.

24.28.5 Procedures for reversionary (e.g. manual) control of the hybrid electrical power system are to be included and are to be verified during practical operation.

24.29 Power system development and integration - Operator training

24.29.1 Training needs specific to the ship and necessary for its safe operation are to be identified and documented in the ship's operating manual.

24.29.2 For **Hybrid Power (+)** notation any ship-specific Operator training is to be verified by the system designer for its completeness and correctness in all operating modes and for all foreseeable normal and abnormal operating and fault conditions with evidence of verification submitted to LR.

24.30 Power system development and integration - Through-life accountability

24.30.1 The activities detailed in *Pt 6, Ch 2, 24.18 Power system development and integration - General* to *Pt 6, Ch 2, 24.29 Power system development and integration - Operator training* are to be maintained throughout the whole lifecycle of a ship and are to be verified at Periodic Survey.

24.30.2 Proposed changes to the hybrid electrical power system including its components that may impact on system safety or dependability are to be formally reviewed and accepted by the system integrator before their incorporation with details submitted to LR.

24.30.3 For **Hybrid Power (+)** notation details of incidents arising during any and all operations of the hybrid electrical power system that has, or could have, resulted in a hazardous consequence for people, platform or the environment are to be monitored.

24.31 Verification requirements

24.31.1 Compliance with the requirements in *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.18* is deemed to satisfy the functional requirements and performance requirements above.

24.32 Testing and trials

24.32.1 Testing and trials in accordance with *Pt 6, Ch 2, 21 Testing and trials* are to be carried out as applicable.

24.32.2 Where required by the *Rules and Regulations for the Classification of Ships, July 2021*, items are to be constructed under survey.

24.32.3 Materials are to be approved, manufactured and tested in accordance with a standard acceptable to LR.

24.32.4 The fault ride-through capability of the system is to be demonstrated during practical tests on the system.

24.32.5 Quality of power supply testing of the system and the components is to be carried out to prove the equipment is capable of operating under the variations specified by the hybrid electrical power system integrator and accepted by LR for all normal and reasonably foreseeable abnormal operating conditions.

24.32.6 Where considered necessary by LR, additional testing may be required.

24.32.7 Satisfactory operation and load testing of the hybrid electrical power system in harbour and during sea trials are to be witnessed by LR.

24.32.8 Measurements are to be taken as part of the trials to verify that the installation will provide a quality of power supply in accordance with the values declared by the hybrid electrical power system integrator as described in *Pt 6, Ch 2, 24.17 Transversal requirements*.

24.32.9 For **Hybrid Power (+)** notation additional trials are to be carried out to:

- (a) Verify that the system delivers the determined levels of performance as described in *Pt 6, Ch 2, 24.5 Hybrid electrical power system performance - System performance targets*;
- (b) Verify that the system fulfils the redundancy principles defined by the hybrid electrical power system integrator as described in *Pt 6, Ch 2, 24.6 Hybrid electrical power system performance - Dependability principles*;
- (c) Verify the correct operation of the additional energy management functionality described in *Pt 6, Ch 2, 24.16 Hybrid electrical power system components - Energy management*;
- (d) Verify that the system performs in accordance with its simulation(s) as described in *Pt 6, Ch 2, 24.23 Power system development and integration - Energy flows* and *Pt 6, Ch 2, 24.24 Power system development and integration - Power system analysis*; and
- (e) Verify the findings of the FMEA analysis detailed in *Pt 6, Ch 2, 24.27 Power system development and integration - System Failure Modes and Effects Analysis (FMEA)* and the response of the system to simulated failures.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 1

Section

- 1 **General requirements**
- 2 **Design criteria**
- 3 **Refrigerating machinery and refrigerant storage compartments**
- 4 **Refrigeration plant, pipes, valves and fittings**
- 5 **Refrigerant detection systems**
- 6 **Electrical installation**
- 7 **Instrumentation, control, alarm, safety and monitoring systems**
- 8 **Personnel safety equipment and systems**
- 9 **Refrigerated cargo spaces**
- 10 **Container ships fitted with refrigerating plant to supply cooled air to insulated containers in holds**
- 11 **Acceptance trials**

■ Section 1 General requirements

1.1 Application

1.1.1 The requirements of this Chapter apply to the refrigerated cargo installations of refrigerated cargo ships, refrigerated container ships, fish factory ships, fishing vessels, fruit juice carriers, and the reliquefaction/refrigerating plant of liquefied gas carriers and chemical carriers or tankers, where an **RMC** notation is requested.

1.1.2 Ships with refrigerated cargo installations which are approved, installed and tested in accordance with these requirements will be eligible for the applicable class notation specified in *Pt 1, Ch 2 Classification Regulations*.

1.1.3 The requirements for the classification of ships for the carriage of liquefied gas are given in Lloyd's Register's (hereinafter referred to as 'LR') *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021* (hereinafter referred to as the Rules for Ships for Liquefied Gases). Where reliquefaction or refrigeration equipment is fitted for cargo temperature and pressure control, the equipment is to comply with the requirements of *Pt 6, Ch 3, 2 Design criteria to Pt 6, Ch 3, 11 Acceptance trials*, as applicable.

1.1.4 The requirements for the refrigeration equipment and systems necessary for provision stores and air conditioning are specified in *Pt 7, Ch 15 Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations*.

1.2 Plans and particulars

1.2.1 The following plans and particulars, as applicable, and any others which may be specially requested for the **refrigerating plant and systems**, are to be submitted in triplicate for approval, before construction is commenced:

- (a) Schematic plans, including full particulars of piping and instrumentations, for:
 - primary and secondary refrigeration systems;
 - air cooler defrosting arrangements;
 - gas reliquefaction systems; and
 - condenser cooling water systems.
- (b) Detailed dimensioned plans and material specifications for:
 - reciprocating compressor crankshaft and crankcase, where exposed to refrigerant pressure;
 - rotary-type compressor rotors and casing;
 - condensers shell and tube and plate type;

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 1

- evaporators shell and tube and plate type;
- air coolers;
- arrangement of air cooling pipe grids and construction method;
- liquid receivers;
- oil separators; and
- any other pressure vessels, *see Pt 5, Ch 11, 1.6 Plans 1.6.1.*
- (c) General arrangement of refrigerating machinery compartment in elevation and plan, showing location and arrangement of the plant, ventilation details and location of temperature sensors and vapour detectors.
- (d) Details of automatic controls, alarms and safety systems, *see Pt 6, Ch 3, 1.1 Application.*
- (e) Details of level indicators.
- (f) Where provision is made for the manufacture and/or storage of inert gas in liquid form, details of the storage vessel insulation arrangements and the reliquefaction equipment and piping system are to be submitted.
- (g) Capacity calculations for pressure relief valves and/or bursting discs, and discharge pipe pressure drop calculations, *see Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.5 to Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.21.*
- (h) Programme of tests to be conducted on completion of the installation, *see Pt 6, Ch 3, 11 Acceptance trials.*

1.2.2 The following plans and particulars, as applicable, and any others which may be specially requested for **refrigerated cargo spaces**, are to be submitted in triplicate for approval, before work is commenced:

- (a) Specification of proposed insulation envelope system, including physical, thermal and fire properties.
- (b) General arrangement of insulated refrigerated spaces in elevation and plan.
 - The plans are to be to a scale adequate for the measurement of the external surfaces and the deck and bulkhead edges.
 - Dimensions and spacing of frames, beams and stiffeners, and details of other steel work intruding into the insulation and within the spaces, are to be shown.
 - Fuel oil and liquid cargo tanks adjacent to or below the refrigerated spaces are to be shown, and whether heating arrangements are provided for such tanks are to be indicated.
 - Ventilating and air-conditioning trunks, and ducts passing through refrigerated spaces are to be shown.
 - The plans are to include a diagram showing the position of the spaces in relation to other parts of the ship if this is not otherwise apparent.
- (c) Plans showing:
 - the thicknesses and methods of attachment of the insulation and linings on all surfaces including girders, hatch coamings and pillars; and
 - details of prefabricated panels and their fixings, vapour barriers, insulated doors and hatch access, bilge and manhole plugs and their frames.
- (d) Methods of attachment of air cooling grids (if fitted) are to be indicated.
- (e) Size and position of refrigerated space pressure equalising devices, where fitted, *see Pt 6, Ch 3, 9.2 Insulation systems 9.2.12 and Pt 6, Ch 3, 9.2 Insulation systems 9.2.13.*
- (f) Arrangements of the drainage system, and sounding and air pipes that pass through the refrigerated spaces.
- (g) Arrangements of air ducts and distribution systems within the refrigerated spaces (including method of cooling spaces within hatch coamings), and air cooler spaces showing location of the coolers and their fans and drive motors.
- (h) Details of temperature indicating, and recording and sensing equipment, and arrangement of sensors within the refrigerated spaces.

1.2.3 Single copies of the following plans and particulars are to be submitted:

- LR Data Sheet for refrigerated cargo installations (LR Form 3905).
- Specification of proposed refrigerating system and auxiliary equipment, including the refrigerating capacities of the compressors, condensers, evaporators and air coolers.
- Heat load calculations at all design operating conditions justifying the refrigerating capacity which is to be installed.

1.3 Materials

1.3.1 Steel plating used in ship construction is to be of an appropriate grade corresponding to the proposed temperature notation, *see Pt 3, Ch 2, 2.2 Refrigerated spaces.*

1.3.2 Materials used in the construction of the refrigerating equipment and associated systems are to be generally manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021* (hereinafter referred to as the Rules for Materials).

1.3.3 Where it is proposed to use materials other than those specified in the Rules for Materials, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement with LR.

1.3.4 All materials used in refrigerating equipment and systems are to be suitable for use with the selected refrigerants. This includes joints, sealing materials and lubricants. For example, the following materials and refrigerants are not to be combined:

- Copper with ammonia.
- Magnesium with fluorinated hydrocarbons.
- Zinc with ammonia or fluorinated hydrocarbons.

1.3.5 For ammonia systems, the condensers/evaporators are to be manufactured in titanium or a suitable grade of stainless steel.

1.4 Equipment to be constructed under survey

1.4.1 All major items of equipment are to be surveyed at the manufacturer's works. The workmanship is to be to the Surveyor's satisfaction and the Surveyor is to be satisfied that the components are suitable for the intended purpose and duty. Examples of such units are:

- Crankshafts, crankcases, rotor shafts and casings for all compressors.
- Condensers.
- Evaporators (secondary refrigerant coolers).
- Air coolers.
- Pressure vessels (e.g. liquid receivers, surge drums, suction separators, intercoolers, oil separators).
- Cooling water pumps for condensers.
- Valves and other components intended for installation in pressure piping systems having a maximum working pressure greater than 0,7 MPa.
- Thermal insulating panels (factory made).

1.5 Type approved equipment

1.5.1 Where it is proposed to use components (e.g. compressors, condensers, oil separators) which have valid LR Type Approval or General Approval Certificates, the types and model numbers of the components are to be stated. Plans of components that have been so approved need not be re-submitted.

1.6 Notation and temperature conditions

1.6.1 The class notation assigned will state the minimum temperature or a temperature range approved by the Committee for the installation with the maximum sea temperature stated, e.g. `✱ Lloyd's RMC to maintain temperature(s) of minus 29°C to plus 14°C with sea temperature plus 32°C maximum'.

1.6.2 For refrigerated installations aboard container ships with approved refrigerating plant and arrangements to supply refrigerated air through ducting to insulated containers, the class notation assigned will additionally specify the maximum number and characteristics of the containers for which the plant is approved, e.g. `to supply refrigerated air at temperatures of minus 25°C to plus 14°C to 800 certified insulated containers with an average thermal transmittance per container of 27 W/K with sea temperature plus 32°C maximum'.

1.6.3 For reliquefaction or refrigerating plants aboard liquefied gas carriers, the notation assigned will state the minimum cargo temperature for which the installation is approved, unless otherwise qualified, see *LR III.3 Class notation (refrigerated installations)* of the Rules for Ships for Liquefied Gases.

1.6.4 On application from an Owner, consideration will be given by the Committee to an alternative temperature notation being assigned to that appearing in the *Register Book*.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 2

1.7 Novel arrangements and design

1.7.1 Where the proposed construction of the refrigerating plant or refrigerated spaces or chambers is novel in design or involves the use of unusual material, special tests may be required, and a suitable class notation may be assigned when the Committee considers this necessary.

1.8 Heat balance tests

1.8.1 A heat balance test will be required as prescribed in *Pt 6, Ch 3, 11 Acceptance trials* on a classed installation, or one being considered for reclassification, when extensive repairs or alterations have been carried out, or when the Surveyors consider that an amended temperature condition should be assigned.

1.9 Controlled atmosphere (CA) systems

1.9.1 Where it is intended to install a CA system on a vessel intended for classification, the requirements of *Pt 7, Ch 1 Controlled Atmosphere Systems* are to be complied with.

1.9.2 Where a **CA** notation is requested by an Owner, it is a prerequisite that the refrigeration installation be assigned an **RMC** notation.

1.10 Spare gear and refrigerant charge

1.10.1 It is recommended that adequate spares, together with the tools necessary for maintenance, or repair, be carried. The spares are to be determined by the Owner according to the design and intended service. The maintenance of the spares is the responsibility of the Owner.

1.10.2 For systems complying with *Pt 6, Ch 3, 2.5 Design pressures 2.5.6* sufficient carbon dioxide is to be carried on board to allow the refrigeration system to be fully recharged. In addition, adequate reserve supplies of refrigerant are to be carried for maintenance purposes. The replacement refrigerant is to be stored in containers complying with *Pt 6, Ch 3, 3.3 Gas storage compartments 3.3.5*.

Section 2 Design criteria

2.1 General

2.1.1 The proposed refrigerating plant, insulation and refrigerants are to be suitable for achieving the designed notation temperature. The refrigerating machinery and all components are to operate satisfactorily under the conditions listed in *Table 1.3.1 Ambient operating conditions* in *Pt 5, Ch 1 General Requirements for the Design and Construction of Machinery*.

2.1.2 The properties of steel materials used in refrigerated holds are to be suitable for the proposed notation temperature.

2.2 Refrigerants and classes of pipes

2.2.1 These Rules are applicable to the primary refrigerants in *Table 3.2.1 Primary refrigerants and their class of pipe*.

2.2.2 Attention is to be given to any statutory requirements, regarding the use of refrigerants, of the National Authority of the country in which the ship is to be registered.

Table 3.2.1 Primary refrigerants and their class of pipe

Refrigerant	Type	Composition	Class of Pipe		
			Class I	Class II	Class III
R-717 (Ammonia)	NH ₃	-	X	-	-
R-22	HCFC	-	-	X	-
R-290 (Propane)	HC	-	-	X	-

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 2

R-600a (Isobutane)	HC	-	-	X	-
R-134a	HFC	-	-	-	X
R-407C	Blend	R-32, R-125, R-134a	-	X	-
R-410A	Blend	R-32, R-125	-	X	-
R-507A	Blend	R-125, R-143a	-	X	-
R-404A	Blend	R-134a, R-125, R-143a	-	X	-
R-744 (Carbon Dioxide)	CO ₂	-	See Pt 6, Ch 3, 2.5 Design pressures 2.5.6		
Note 1. HCFC - Hydrochlorofluorocarbon.					
Note 2. HFC - Hydrofluorocarbons.					
Note 3. HC – Hydrocarbon.					
Note 4. In view of increasing world-wide restrictive legislation and phasing out of the refrigerants R-22, it is recommended that this refrigerant should not be used in any new installation.					
Note 5. Although ozone depleting and global warming potentials are not included in these Rules for Classification, these effects are important and need to be considered when selecting the refrigerant for a particular application.					

2.2.3 Within the parameters of pressures, temperatures, toxic nature and flammability, the class of pipe to be used with various refrigerants is shown in *Table 3.2.1 Primary refrigerants and their class of pipe*.

2.2.4 Design conditions as applicable to the classes of pipes are defined in *Pt 5, Ch 12, 1.5 Design temperature*.

2.2.5 The materials of Class I and Class II piping systems are to be manufactured at a works approved by LR and tested in accordance with the appropriate requirements of Rules for Materials. Particular attention is drawn to *Ch 6, 4 Ferritic steel pressure pipes for low temperature service*, of the Rules for Materials, where testing requirements for pipes used for low temperature service are given.

2.2.6 The materials of Class III piping system are to be manufactured and tested in accordance with the requirements of acceptable National Specifications. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of materials.

2.2.7 Particulars of refrigerating systems using refrigerants other than those listed will be given special consideration.

2.3 Refrigeration units

2.3.1 A refrigerating unit is considered to comprise a compressor, its driving motor and one condenser. Where a secondary refrigerant, such as brine, is employed, the unit is also to include an evaporator (secondary refrigerant cooler) and a brine pump.

2.3.2 Two or more compressors driven by a single motor, or having only one condenser or evaporator (secondary refrigerant cooler) are to be regarded as one unit.

2.3.3 The refrigerating units of a classed cargo installation are to be completely independent of any refrigerating machinery associated with air-conditioning plant, or any domestic refrigerated installation, or any process plant, unless full details of any proposal have been submitted and approved.

2.4 Refrigeration capacity

2.4.1 The refrigeration capacity provided is to be sufficient to maintain the temperatures specified in the class notation when operating 24 hours per day with one unit on standby. The plant is to be able to cool down a complete cargo to its carrying temperature within the time specified by the manufacturer. The standby unit may be considered as an operating unit during the cooling down period of a non-precooled cargo. In order to compensate for deterioration of machinery and insulation over the life of the installation, the equipment is to be designed to have at least five per cent excess capacity over that required for maximum design output.

2.4.2 The proposals of both machinery and insulating contractors will be evaluated by LR in determining the theoretical capabilities of the equipment to maintain the duty temperatures. LR will advise the contractors after appraisal of the specification and plans if it is considered that additional refrigeration or insulating effect is required, but the temperature assigned on completion of the capacity heat balance test will be determined from the actual results of the test.

2.4.3 Where the units are not connected in common to all refrigerated chambers, the equipment serving each group of chambers is to comply with *Pt 6, Ch 3, 2.4 Refrigeration capacity 2.4.1*.

2.4.4 In the case of installations having a large number of small units arranged to serve individual chambers or groups of chambers, the question of standby capacity will be specially considered.

2.4.5 Where only two refrigerating units are fitted, the working parts are to be interchangeable.

2.4.6 Where a refrigerating plant is provided for sub-cooling the liquid refrigerant of other units, but is not arranged for cooling the cargo chambers independently, it will not be regarded as a unit.

2.5 Design pressures

2.5.1 The design pressure of the system will be regarded as equal to its maximum working pressure.

2.5.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No relief valve is to be set to a pressure higher than the maximum working pressure.

2.5.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure system.

2.5.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be $1,11 \times P_b$, where P_b is an allowance for the compressor high pressure cut-out. P_b is to be at least equal to $1,11 \times P_a$, where P_a is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure at 46°C.

2.5.5 Design pressures (MPa g) applicable to refrigerants are to be not less than the values given in *Table 3.2.2 Pressure limits* when condensers are sea-water cooled. The design pressure for other refrigerants and condensing arrangements is to be agreed with LR.

2.5.6 Due to the low critical temperature of carbon dioxide it is inappropriate to determine the design pressure in accordance with *Pt 6, Ch 3, 2.5 Design pressures 2.5.3*. The proposed design pressure for a carbon dioxide system is to be stated, taking account of the maximum working pressure and the maximum pressure at rest conditions. Where the maximum pressure at rest condition is maintained by the fitting of a supplementary refrigeration unit, condensing the vapour in a holding vessel, supporting calculation is to be provided to show that this can be undertaken with a local ambient temperature of 45°C. The holding vessel is to be thermally insulated to prevent the operation of the relief devices within a 24 hour period after stopping the supplementary refrigeration unit at an ambient temperature of 45°C and an initial pressure equal to the starting pressure of the refrigeration unit. *Pt 6, Ch 3, 2.5 Design pressures 2.5.7*

2.5.7 Where a carbon dioxide system is designed for hot gas defrosting, due regard is to be given to the possibility of a higher pressure being imposed on the low pressure system. The design pressure for this section of the system shall be 10 per cent above the maximum pressure experienced during defrosting.

Table 3.2.2 Pressure limits

Refrigerant	Pressure (MPa g)	
	High	Low
R-717	2,12	1,72
R-22	2,06	1,67
R-290	1,81	1,47
R-600a	0,64	0,52
R-134a	1,34	1,09
R-407C	2,35	1,90
R-410A	3,314	2,99
R-507A	2,53	2,05

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 3

R-404A	2,48	2,01
R-744	See Pt 6, Ch 3, 2.5 Design pressures 2.5.6	

2.6 Insulation

2.6.1 Properties of materials used for thermal insulation are to be verified against known standards for the following parameters, as applicable, to ensure that they are adequate for the intended service. The test results are to be made available to LR for approval:

- Closed cell content.
- Density.
- Mechanical properties.
- Thermal expansion.
- Abrasion.
- Cohesion.
- Thermal conductivity.
- Resistance to fire and flame spread.
- Ageing.
- Bonding (adhesive and cohesive strength).

2.6.2 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted for approval.

2.6.3 Where applicable, having regard to their location and environmental conditions, insulation materials are to be:

- suitably resistant to fire;
- suitably resistant to the spreading of flame;
- adequately protected against penetration of water vapour; and
- adequately protected against mechanical damage.

Section 3 Refrigerating machinery and refrigerant storage compartments

3.1 General

3.1.1 Refrigerating machinery is to be located in a well ventilated compartment. In general, the arrangements are to be such that all components of the refrigerating machinery can be readily opened up for inspection or replacement. Space is to be provided for the withdrawal and renewal of the tubes in 'shell-and-tube' type evaporators (brine coolers) and condensers. Proposals for alternative arrangements are to be submitted for consideration. See Pt 6, Ch 3, 3.2 Arrangements for compartments housing machinery using ammonia for refrigerating machinery using ammonia.

3.1.2 Refrigerating machinery using toxic and/or flammable refrigerants is to be located outside the main machinery space in a separate gastight compartment.

3.1.3 Where the refrigerating machinery is located in a separate gastight compartment, outside the main machinery space, this compartment is to be equipped with effective mechanical ventilation to provide 30 air changes per hour based upon the total volume of the space. The mechanical ventilation is to have two main controls, one of which is to be operable from a place outside the compartment.

3.1.4 Refrigerating machinery using non-toxic and non-flammable refrigerants will not, in general, be required to be located in a separate compartment outside the main machinery space.

3.1.5 Openings for pipes, electrical cables and other fittings in the bulkheads and deck are to be fitted with gastight seals.

3.1.6 Ammonia piping is not to pass through accommodation spaces.

3.2 Arrangements for compartments housing machinery using ammonia

3.2.1 Where ammonia refrigerant is used, the refrigerating machinery shall be installed in a dedicated gastight compartment. *See also Pt 6, Ch 3, 3.2 Arrangements for compartments housing machinery using ammonia 3.2.9.*

3.2.2 The compartment containing ammonia refrigerating machinery and any access ways are to be provided with independent mechanical ventilation capable of:

- removing the heat generated by the equipment installed in the compartment;
- maintaining the atmosphere in the compartment at acceptable vapour threshold levels under normal operating conditions; and
- disposing of ammonia vapour safely and quickly in the event of a major leakage.

3.2.3 The ventilation system is to be of the negative pressure type where abnormal stoppages of the extraction fans activate an audible and visual alarm.

3.2.4 Compartments containing ammonia refrigerating machinery, including process vessels, are to be provided with:

- a negative ventilation system, independent of ventilation systems serving other spaces, having a capacity of not less than 30 air changes per hour based upon the total volume of the space. Other suitable arrangements which ensure an equivalent effectiveness may be considered;
- fresh air inlets, located at a low level in the machinery compartment and arranged so as to provide a supply of fresh air and to minimise the possibility of re-cycling the exhaust air from the outlet;
- exhaust outlets, located at a high level and arranged so as to promote good air distribution throughout the compartment;
- a fixed ammonia detector system with alarms inside and outside the compartment;
- water screens above all access doors, operable manually from outside the compartment in all ambient conditions;
- an independent bilge system;
- where the charge is greater than 50 kg, emergency body shower and eye wash facilities shall be installed locally outside the compartment. The water for the shower is to be thermostatically controlled so as to avoid low temperature shock.

3.2.5 Compartments are to have at least two access doors, opening outwards, one of which is to be an emergency exit giving direct access to the open deck. The doors are to be fitted with an easily operated opening mechanism to facilitate rapid escape in an emergency. In the case of small compartments where more than one door would be impractical, the emergency exit only is to be provided.

3.2.6 At least two sets of self-contained breathing apparatus and protective clothing are to be provided, readily available in the vicinity of the compartment but external to the area of risk. *See Pt 6, Ch 3, 8.1 Personnel safety equipment 8.1.4.*

3.2.7 The location of the exhaust duct, from the compartment or area, is to be free from obstruction and be such as not to cause danger. Where practicable, they are to be 10 m, where practicable, in the horizontal direction from other ventilation intakes and openings to accommodation and other enclosed areas, and at least 2 m above the surrounding deck.

3.2.8 Ventilation fans are not to produce a source of vapour ignition in either the ventilated compartment/area or ventilation system. Ventilation fans and fan ducts, in way of fans only, are to be of non-sparking construction.

3.2.9 In the case of ammonia plants on fishing ships under 55 m overall length, or ammonia plants with a charge of ammonia not greater than 25 kg, the refrigerating machinery may be located in the main machinery space provided it complies with the following requirements:

- The entrance to the machinery space is properly illuminated and marked and has warning signs permanently posted.
- The area where the ammonia machinery is installed is served by a hood with a negative ventilation system, so as not to permit any leakage of ammonia dissipating into other areas.
- A water spray system is provided for the area.
- Coamings, of not less than 150 mm in height, are installed around the ammonia machinery area.
- A fixed ammonia detector system with alarms inside and outside the main machinery space is provided.
- Means are provided for stopping the ammonia compressor prime movers from a position outside the machinery space.
- At least two sets of self-contained breathing apparatus and protective clothing are to be provided readily available in the vicinity of the compartment but external to the area of risk. *See Pt 6, Ch 3, 8.1 Personnel safety equipment 8.1.4.*
- Air intakes of other machinery are located away from the ammonia machinery area as far as is practicable.

3.3 Gas storage compartments

3.3.1 Portable steel cylinders containing reserve supplies of refrigerant are to be stored in a well ventilated compartment reserved solely for this purpose.

3.3.2 The compartment is to be provided with a mechanical ventilation system providing 10 air changes per hour and is to have at least one door opening outwards giving direct access to open deck.

3.3.3 Bulk storage tanks holding more than 150 kg of replacement carbon dioxide are to be located in a separate compartment. The compartment is to be provided with a mechanical ventilation system having a minimum capacity of 6 air changes per hour. The ventilation system exhaust ducting is to remove air from the base of the compartment. The compartment is to be fitted with a gas tight access door opening outward.

3.3.4 The compartment is to be provided with a refrigerant vapour detection system.

3.3.5 The compartment is to be provided with suitable water drainage arrangements not connected with the main machinery spaces.

3.3.6 Steel storage cylinders are to be of an approved type, supplied by the refrigerant manufacturer and are to be filled to a level suitable for an ambient temperature of plus 46°C.

3.3.7 The compartment is to be provided with racks to facilitate secure stowage of the cylinders.

3.4 Compartments housing carbon dioxide containing equipment

3.4.1 Self closing gas tight access doors are to be provided between each compartment and the dedicated escape routes. *See Pt 6, Ch 3, 5.1 General 5.1.5.*

3.4.2 In compartments which are normally occupied and where the volume of ventilation required by *Pt 6, Ch 3, 3.1 General 3.1.3* is not desirable, such as production areas on fishing vessels, a negative pressure ventilation system, capable of 10 air changes per hour, is required to be fitted. This ventilation system is to be automatically activated when, in the event of a leak the concentration of carbon dioxide reaches a predetermined level but in no case higher than the threshold limit value of 5,000 ppm.

■ Section 4

Refrigeration plant, pipes, valves and fittings**4.1 General requirements for refrigerating compressors**

4.1.1 New compressor types or developments of existing types are to be subjected to an agreed programme of type testing to complement the design appraisal and review of documentation.

4.1.2 Where it is proposed to treat the bearing surfaces either by local hardening or by chromium plating, then these processes are to be confined to the bearing area and not extended to the fillets. Particulars of the process are to be submitted.

4.1.3 Where ball or roller bearings are incorporated, they are to have a minimum life expectancy of 25 000 running hours, for the application in question.

4.1.4 A check valve is to be fitted to each compressor discharge.

4.1.5 Where off-loading devices are incorporated, arrangements are to be provided which indicate the extent of the off-loading being effected.

4.1.6 A pressure relief valve and/or safety disc is to be fitted between each compressor and its gas delivery stop valve in accordance with *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.5* and *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.6*.

4.1.7 Stop valves are to be provided on compressor suctions and discharges.

4.1.8 Suction strainers and lubricating oil filters are to be provided and so arranged that they are easily accessible for cleaning or renewal of the filter elements, without substantial loss of refrigerant or lubricating oil.

4.1.9 The correct direction of rotation is to be permanently indicated.

4.1.10 Where any hermetic or semi-hermetic compressor has the electric motor cooled by the circulating refrigerant, the following arrangements are to be provided:

- (a) Refrigeration circuits are to contain no more than one hermetic or semi-hermetic compressor.
- (b) Every compressor motor is to be fitted with a thermal cut-out device to protect the motor against overheating.
- (c) In each refrigeration circuit containing a hermetic or semi-hermetic compressor, suitable arrangements shall be provided to remove debris and contaminants resulting from a motor failure. *See Pt 6, Ch 3, 4.16 Filters, driers and moisture indicators 4.16.1.*
- (d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of Pt 5, Ch 11 and Ch 17 as applicable. Plans are to be submitted for consideration as required by Pt 5, Ch Pt 5, Ch 11, 1.6 Plans.

4.2 Reciprocating compressors

4.2.1 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:

- (a) Carbon and carbon-manganese steel castings -
400 to 550 N/mm².
- (b) Carbon and carbon-manganese steel forgings (normalised and tempered) -
400 to 600 N/mm².
- (c) Carbon and carbon-manganese steel forgings (quenched and tempered) -
not exceeding 700 N/mm².
- (d) Alloy steel castings -
not exceeding 700 N/mm².
- (e) Alloy steel forgings -
not exceeding 1000 N/mm².
- (f) Spheroidal or nodular graphite iron castings -
370 to 800 N/mm².
- (g) Grey iron castings -
not less than 300 N/mm².

4.2.2 Where it is proposed to use materials outside the ranges specified in *Pt 6, Ch 3, 4.2 Reciprocating compressors 4.2.1*, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

4.2.3 Materials for components of reciprocating compressors such as crankshafts, pistons, piston rods, crank cases, etc. are to be produced at a works approved by LR and in general to be tested in accordance with the Rules for Materials.

4.2.4 A fully documented fatigue strength analysis is to be submitted indicating a factor of safety of 1,5 at the design loads based on a suitable fatigue strength criteria. Alternatively, the requirements of *Pt 6, Ch 3, 4.2 Reciprocating compressors 4.2.5 to Pt 6, Ch 3, 4.2 Reciprocating compressors 4.2.9* may be used.

4.2.5 The diameter, d , of a compressor crankshaft using one of the refrigerants detailed in *Pt 6, Ch 3, 2.5 Design pressures*, is to be not less than that determined by the following formula, when all cranks are located between two main bearings:

$$d = V_c \left(\frac{D^2 p Z}{7,85} \left(\frac{S}{16} + \frac{ab}{a+b} \right) \right)^{1/3} \text{ mm}$$

where

a = distance between inner edge of one main bearing and the centreline of the crankpin nearest the centre of the span, in mm

b = distance from the centreline of the same crankpin to the inner edge of the adjacent main bearing, in mm

$a + b$ = span between inner edges of main bearings, in mm

d_p = proposed minimum diameter of crankshaft, in mm

where

p = design pressure, in MPa g, as defined in *Pt 6, Ch 3, 2.5 Design pressures*

D = diameter of cylinder, in mm

S = length of stroke, in mm

V_c = 1,0 for shafts having one cylinder per crank, or

= 1,05 for 90° between adjacent cylinders on the same crankpin

= 1,18 for 60° between adjacent cylinders on the same crankpin

= 1,25 for 45° between adjacent cylinders on the same crankpin

= for the shaft and cylinder arrangements as detailed in *Table 3.4.1 Angle between cylinders*

$$Z = \frac{560}{\sigma_u + 160} \text{ for steel}$$

$$Z = \frac{700}{\sigma_u + 260 - 0,059d_p} \text{ for spheroidal or nodular graphite cast iron}$$

$$Z = \frac{700}{\sigma_u + 260 - 0,069d_p} \text{ for grey cast iron}$$

σ_u = specified minimum tensile strength of crankshaft material, in N/mm².

4.2.6 Where the shaft is supported additionally by a centre bearing, the diameter is to be evaluated from the half shaft between the inner edges of the centre and outer main bearings. The diameter so found for the half shaft is to be increased by six per cent for the full length shaft diameter.

Table 3.4.1 Angle between cylinders

Number of crankpins	Number of cylinders per crank	Angle between cylinders, in degrees		
1 or 2	2	45	60	90
3	2	45	60	-
4	2	45	60	-
1	3	45	60	90
2	3	45	60	-
3	3	45	-	-
1	4	45	60	-
2	4	45	-	-

4.2.7 The dimensions of crankwebs are to be such that Bt^2 is to be not less than given by the following formulae:

= $0,4d^3$, for the web adjacent to the bearing

= $0,75d^3$, for intermediate webs where a single intermediate web is common to two adjacent crankthrows

where

B = breadth of web, in mm

d = minimum diameter of crankshaft as required by *Pt 6, Ch 3, 4.2 Reciprocating compressors 4.2.5*, in mm

t = axial thickness of web which is to be not less than $0,45d$ for the web adjacent to the bearing, or $0,60d$ for intermediate webs, in mm.

4.2.8 Fillets at the junction of crankwebs with crankpins or journals are to be machined to a radius not less than $0,05d$. Smaller fillets, but of a radius not less than $0,025d$, may be used provided the diameter of the crankpin or journal is not less than cd ,

where

$$c = 1, 1 - 2\frac{r}{d} \text{ but to be taken as not less than } 1,0$$

d = minimum diameter of crankshaft as required by *Pt 6, Ch 3, 4.2 Reciprocating compressors 4.2.5*, in mm

r = fillet radius, in mm.

4.2.9 Fillets and oil holes are to be rounded to an even contour and smooth finish.

4.2.10 An oil level sight glass is to be fitted to the crankcase.

4.2.11 Compressors with cylinder bores in excess of 50 mm diameter are to be provided with arrangements to relieve high cylinder pressures such as would result from 'hydraulic lock' (i.e. liquid refrigerant in the cylinders). Alternatively the provision of positive means to prevent liquid refrigerant reaching the compressor may be accepted.

4.2.12 The crankcases of trunk piston compressors are to be designed to withstand a pressure equal to the maximum working pressure of the system. The crankcases of compressors of the crosshead type which are substantially isolated from the refrigerant circuit may be designed for lower pressures but are to be provided with relief valves adjusted to lift at a pressure not exceeding the design pressure, and discharging to a safe place.

4.2.13 A crankcase heater, arranged to be energised when the compressor is stopped, is to be provided.

4.3 Screw compressors

4.3.1 For screw-type compressors, the materials of the rotors and casings are to be produced, and the manufacture is to be carried out, at a works approved by LR, and in general, they are to be tested in accordance with the Rules for general machinery forgings.

4.3.2 The rotor casing is to be designed for the maximum pressure to which it may be subjected, see *Pt 6, Ch 3, 2.5 Design pressures*.

4.3.3 Where gearing is fitted to increase the rotor speed and also to locate the rotors, the gearing is to comply with *Pt 5, Ch 5 Gearing*. The manufacturer's maximum allowable tolerances for clearances and backlash between mating rotors are to be stated.

4.4 Pressure vessels and heat exchangers

4.4.1 The term 'pressure vessel' will normally apply to receivers and heat exchangers, and does not include any of the following:

- Compressors.
- Liquid refrigerant pumps.
- Pipes and their fittings.

The use of plate heat exchangers will be specially considered on submission of plans, and special tests may be required.

4.4.2 Fusion welded steel pressure vessels exposed to the pressure of the refrigerants are to be constructed in accordance with the requirements of *Pt 5, Ch 11 Other Pressure Vessels* and *Pt 5, Ch 17 Requirements for Fusion Welding of Pressure Vessels and Piping*. Plans are to be submitted for consideration if required by *Pt 5, Ch 11, 1.6 Plans*.

4.4.3 Where ammonia is the refrigerant, the pressure vessels are to be constructed to at least Class 2/1 requirements.

4.4.4 Pressure vessels for the containment of primary refrigerants for use in conventional refrigeration circuits where the pressure/saturation temperature relationship applies are not required to be low temperature impact tested unless the design temperature is lower than minus 40°C.

4.4.5 Pressure vessels are to be thermally insulated to an extent which will minimise condensation of moisture from the surrounding atmosphere. The insulation is to be provided with an efficient vapour barrier and adequately protected from mechanical damage. Prior to applying the insulation, the steel surfaces are to be suitably protected against corrosion.

4.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated is to be protected with overpressure relief devices, see *Pt 6, Ch 3, 4.15 Overpressure protection devices*.

4.5 Condensers, oil coolers and evaporators

4.5.1 In order to minimise the risk of corrosion, where the refrigerant is ammonia, the material interface between the primary refrigerant and cooling water or secondary refrigerant is to be of a suitable grade of stainless steel. Carbon-manganese steel with a suitable inhibitor would also be acceptable.

4.5.2 Space is to be provided for the withdrawal and replacement of condenser and evaporator tubes, see *Pt 6, Ch 3, 3.1 General 3.1.1*.

4.5.3 Where ammonia is used as the refrigerant, the refrigerating plant is to comply with the following additional requirements:

- (a) Automatic air purgers are to be provided, with their discharges being led through water before venting to atmosphere.
- (b) The cooling water returns from sea-water cooled condensers are not to be led into the main machinery spaces.
- (c) Fresh water condenser cooling systems are to be provided with pH meters to activate audible and visual alarms in the event of an ammonia leak.

4.6 Liquid receivers

4.6.1 Primary refrigerating systems are to be provided with liquid receivers with sufficient capacity to hold the complete refrigerant charge to prevent emission of the refrigerant to the atmosphere during servicing or repairs.

4.6.2 Alternatively, in systems using a secondary refrigerant, with a number of units, smaller receivers may be used provided the system includes a common storage receiver with sufficient capacity to hold at least the primary refrigerant charge from two units. The common receiver is to be provided with the necessary crossover connections to facilitate transfer of refrigerant to and from each unit in the system.

4.7 Oil separators

4.7.1 Oil separators are to be provided at compressor discharges and are to be fitted with a control arrangement to enable the separated oil to be returned to the compressor crankcase. Wire gauze used in separators is to be sufficiently robust and well supported.

4.8 Air coolers and cooling grids

4.8.1 Refrigerated spaces may be cooled by air coolers or cooling grids on the ceiling, bulkheads, and sides. In order to minimise the dehydration of the cargo and the frosting of the air coolers or cooling grids, the installation is to be designed to maintain the required notation temperatures with a minimum of difference between the refrigerant and space temperatures.

4.8.2 Individual spaces are to have a minimum of two independent air coolers, each comprising one or more fans and one or more refrigerant circuits in a single casing and with isolating valves. Alternatively, multiple circuits each with their own fan(s), in a single cooler casing may each be regarded as a separate cooler, provided stop valves are fitted so that each circuit may be isolated.

4.8.3 For refrigerated spaces having a net volume of 300 m³ or less, a single cooler with one circuit will be accepted.

4.8.4 The refrigeration capacity of the air cooler arrangement is to be such that the notation temperature conditions can be maintained with any one independent cooler or circuit out of action. The capacities of the fans are also to be such that they can maintain the required air flow rates (see also *Pt 6, Ch 3, 9.4 Air circulation and distribution*) and uniform air temperature throughout the refrigerated spaces, when part or fully loaded with cargo, with any one cooler or fan out of action.

4.8.5 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.

4.8.6 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. Provision is to be made for the prevention of freezing of the condensate.

4.8.7 Air coolers are to be located such that when the refrigerated spaces are loaded with cargo, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.

4.8.8 The cooling grids in each refrigerated space are to be arranged in not less than two sections, and each section is to be fitted with valves so that it can be shut off. The notation temperature conditions are to be capable of being maintained with any one section isolated. For spaces having a net volume of 300 m³ or less, a single section will be acceptable.

4.8.9 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

4.9 Refrigerant pumps

4.9.1 Pumped primary and/or secondary refrigerant systems are to have a minimum of two pumps. Each pump is to be capable of operating on all cargo chambers and maintaining full duty with any one pump out of operation.

4.9.2 Primary and, where appropriate, secondary refrigerant pumps are to be provided with pressure relief valves, see *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.13*.

4.10 Condenser cooling water pumps

4.10.1 At least two separate condenser cooling water pumps are to be installed. One of the pumps may be considered as a standby pump and may be used for other purposes, provided that it is of adequate capacity and its use on other services does not interfere with the supply of cooling water to the condensers.

4.10.2 Not less than two sea inlets are to be provided supplying sea-water to the pumps for condenser cooling. It is recommended that one of the sea inlets be provided on the port side and the other on the starboard side. The sea inlets are to be fitted in accordance with *Pt 5, Ch 13, 2.6 Piping systems – Installation*.

4.10.3 The cooling water pumps and sea inlets are to be suitably valved and cross-connected with each condenser.

4.10.4 Suitable spring-loaded safety valves are to be provided in each cooling water circuit, see *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.13*.

4.11 Piping systems

4.11.1 All piping, valves and fittings are to be suitable for the maximum pressure to which the system can be subjected and are to comply with the requirements of *Pt 5, Ch 12 Piping Design Requirements*.

4.11.2 Pipework for Ammonia (R-717) is to comply with Class 1 requirements.

4.11.3 In addition to visual examination of pipe welds, non-destructive examination of pipe welds is to be carried out in accordance with the requirements of *Ch 13 Requirements for Welded Construction* of the Rules for Materials, to the satisfaction of the Surveyors.

4.11.4 All steel pipework on the low temperature part of the system is to be protected against external corrosion. Protective coatings are to be removed from pipe surfaces to a distance of not less than 50 mm either side of the joint weld preparations prior to welding. On completion of welding and testing a protective coating is to be applied.

4.11.5 Where brine is the secondary refrigerant, piping and tanks should not be galvanised on the brine side. If any parts of the brine system have been galvanised, the brine cooling and return tanks are to be provided with a ventilating pipe or pipes led to the atmosphere in a location where no damage will arise from the gas discharged. The ventilation pipes are to be fitted with wire gauze diaphragms which can be readily renewed.

4.11.6 Copper piping is to be manufactured in accordance with *Pt 5, Ch 12, 3 Copper and copper alloys* except in the case of small air coolers having finned pipes of sizes not greater than 19 mm outside diameter, and which have been fabricated under workshop conditions. The finned pipes may have a minimum wall thickness of 0,5 mm when used with R-22 and R-134a refrigerants.

4.11.7 Where the use of plastic pipe is proposed in a secondary refrigerant system (e.g. brine), it is to be in accordance with *Pt 5, Ch 12, 5 Plastic pipes*.

4.11.8 Pipelines are to have ample provision for expansion and contraction in service conditions. In general, expansion bends are to be used for this purpose. However, the use of metallic expansion bellows will be accepted provided test data is produced showing satisfactory strength and fatigue properties under the appropriate conditions.

4.11.9 All pipelines are to be fully supported and secured so as to prevent vibration. Flexible hoses may be used, where necessary, to prevent transmission of vibration provided the documentation in *Pt 6, Ch 3, 4.11 Piping systems 4.11.8* is provided. Flexible hoses are to be of a type which has been approved by LR, see *Pt 5, Ch 12, 7 Flexible hoses*.

4.11.10 Pipework, which may contain low temperature refrigerant, except within secondary refrigerant cooler rooms, is to be thermally insulated to an extent which will minimise condensation of moisture. Insulation in pre-formed sections is recommended. If *in situ* foamed insulation is employed, pre-production testing on site is to be carried out to the satisfaction of the Surveyor, using a 'mock-up' representative of the system to be employed.

4.11.11 All pipe insulation is to be provided with an efficient vapour barrier, care being taken to ensure that it is not interrupted in way of supports, valves, etc. Also adequate protection of insulation surfaces from mechanical damage is to be provided.

4.11.12 Where refrigerating piping is embedded in the cargo chamber insulation, the locations of the pipe joints are to be marked on the outside of the insulation lining.

4.12 Joints

4.12.1 Butt welded pipe joints are to be employed as far as practicable. Socket welded pipe joints are acceptable up to 25 mm diameter. Flanged or other joints are to be kept to a minimum and, in general, are to be restricted to connections with items of machinery or components which may have to be removed for maintenance purposes. Connections to valves are normally to be welded unless they are of a type, or in a position, which precludes *in situ* maintenance.

4.12.2 Pipe connections to fittings (e.g. gauge lines, level controls) which are likely to be subjected to heavy corrosion, are to be of heavy gauge construction, or be made from suitable corrosion resistant materials.

4.13 Liquid level indicators

4.13.1 Where liquid level indicators of the 'see-through' variety are used they are to be of the flat plate type incorporating glass (or equivalent material) of heat resistant grade.

4.13.2 All level indicators are to be provided with automatic shut-off devices and isolating valves. Plate-type sight glasses which form an integral part of the component in which they are mounted (e.g. compressor crankcases, pressure vessels) are exempt from this requirement.

4.13.3 All level indicators are to be suitable for the system maximum working pressure and tested accordingly.

4.14 Automatic expansion valves

4.14.1 Refrigerating systems with automatic expansion valves are also to be provided with efficient hand expansion valves and the arrangement is to be such that the automatic expansion valves can be by-passed and isolated.

4.14.2 As an alternative, duplicate automatic expansion valves may be fitted, each valve to be capable of the required duty and operable with the other out of action.

4.15 Overpressure protection devices

4.15.1 Refrigeration systems are to be provided with relief devices, but it is important to avoid circumstances which would bring about an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that pressure due to fire conditions will be safely relieved.

4.15.2 Pressure relief devices are to be mounted in such a way that it is not possible to isolate them from the part of the system which they are protecting except that, where duplicated, a changeover valve may be fitted which will allow either device to be isolated for maintenance purposes without it being possible to shut off the other device at the same time.

4.15.3 Relief discharge is to be led to a safe place above deck away from personnel accesses and air intakes. Discharge piping should be designed to preclude ingress of water, dirt or debris which may cause the equipment to malfunction.

4.15.4 For ammonia systems, discharge from relief valves is to be led through water before venting to the atmosphere. Vapour detectors are to be provided in the discharge pipes to activate audible and visual alarms in the event of a leakage of ammonia.

4.15.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The flow capacity of the valve or disc is to exceed the full load compressor capacity on the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

4.15.6 Compressors protected by bursting discs are to be provided with automatic shutdown in the event of high discharge temperatures.

4.15.7 Each compressor is to be provided with automatic shutdown in the event of high discharge pressure. For refrigeration systems where the maximum working pressure is less than or equal to 4 MPa the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,9 of the maximum working pressure. For refrigeration systems where the maximum working pressure is greater than 4 MPa the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,95 of the maximum working pressure.

4.15.8 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of stop or automatic control or check valves is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device.

4.15.9 Pressure vessels which are interconnected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any vessel.

4.15.10 Omission of one of the specified relief devices and the changeover device, as required by *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.8*, will be allowed where:

- vessels are of less than 300 litres internal gross volume; or
- vessels discharge into the low pressure side by means of a relief valve; or
- vessels operating using only cargo gas and, which can be independently isolated and gas freed during normal cargo operations provided that a shelf spare is carried.

4.15.11 Sections of systems and components which could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.

4.15.12 Refrigerant pumps are to be provided with pressure relief valves on the discharge side, which may relieve to the suction side, or to another suitable location.

4.15.13 Suitable spring-loaded safety valves are to be provided on the cooling liquid side of condensers and the brine side of evaporators where the pressure from any pump or expansion of the liquid in the circuit could exceed the design pressure of the system or any component forming part of the cooling system.

4.15.14 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system, as defined in *Pt 6, Ch 3, 2.5 Design pressures*.

4.15.15 When satisfactorily adjusted, relief valves are to be protected against tampering or interference by a wire with a lead seal or similar arrangement.

4.15.16 Valves which are arranged to discharge to the low pressure side of the system are to be substantially independent of back pressure and are to be of a type which has been approved by LR.

4.15.17 The minimum required discharge capacity related to air of the pressure relief device for each pressure vessel is to be determined as follows:

$$C = D L f$$

where

C = minimum required discharge capacity related to air of each relief device, in kg/s

D = outside diameter of the vessel, in metres

L = length of the vessel, in metres

f = factor which is dependent on the refrigerant:

R-717 (Ammonia)	0,041
R-22, R-134a, R-407C	0,131
R-290 (Propane), R-600a (Isobutane)	0,082
R-410A, R-404A, R-507A	0,203
R-744 (Carbon dioxide) (when used on the low side of a cascade system)	0,082.

4.15.18 The rated discharge capacity of the pressure relief valves expressed in kg/s of air is to be determined in accordance with an appropriate recognised National Standard such as *ISO 5149 Mechanical Refrigeration Systems used for Cooling and Heating – Safety Requirements*.

4.15.19 The rated discharge capacity of a bursting disc discharging to atmosphere under critical flow conditions is to be determined by the following formula:

$$d = 85,75 \sqrt{10 \frac{C}{P}} \text{ mm}$$

where

d = minimum diameter of free aperture of bursting disc, in mm

C = minimum required air equivalent discharge capacity, in kg/s, see *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.17*

P = $1,1 \times$ maximum working pressure, see *Pt 6, Ch 3, 2.5 Design pressures*.

4.15.20 The bore of the discharge pipe shall be at least the same bore as the relieving device outlet. The size of a common discharge line serving two or more pressure relieving devices which may discharge simultaneously shall be based on the sum of their outlet areas. Where discharge lines are long or where the outlets of two or more pressure relieving devices are connected into a common line, the discharge piping shall be sized such that the back pressure at full relief rate does not exceed 10 per cent of the relief valve set pressure.

4.15.21 Due account is to be taken of the reaction force on a relief valve or on discharge piping during discharge and adequate support provided.

4.15.22 As carbon dioxide can form a solid powder at atmospheric pressure, there is a possibility that relief devices will choke if vented directly to atmosphere. The method used to guard against the formation of powder is to be submitted for consideration.

4.15.23 In carbon dioxide systems, overpressure protection is to be fitted to pipelines or components which can be isolated in a liquid full condition. Pressure relief devices are to be arranged such as to vent vapour at all times.

4.15.24 In cascade systems where carbon dioxide is used in combination with ammonia, the effects of carbon dioxide leaking into the ammonia side are to be considered. It may be desirable to design the ammonia system to either withstand the design pressure on the carbon dioxide side or have relief arrangements to safely deal with the additional vapour produced if a leak occurs.

4.16 Filters, driers and moisture indicators

4.16.1 Suitable filters are to be provided in the refrigerant gas lines to compressors and in the liquid lines to refrigerant flow controls. Wire gauze used in filters is to be sufficiently robust and well-supported. A filter may be combined with the oil separator required by *Pt 6, Ch 3, 4.7 Oil separators 4.7.1*. Stop valves are to be provided to allow for servicing of filters. After first commissioning of the system, the filters should be examined to confirm that elements remain intact and not collapsed.

4.16.2 Refrigerant filters, driers and moisture indicators are to be fitted in halocarbon refrigerant systems, and the arrangement is to be such that filters and driers can be by-passed, isolated and opened up without interrupting plant operations.

4.17 Purging devices

4.17.1 Where the operating pressure of the low pressure system may be below atmospheric, a purging device is to be provided, the discharge from which is to be led to a safe place above deck.

4.18 Piping in way of refrigerated spaces

4.18.1 All sounding pipes, whether for compartments or tanks, which pass through refrigerated spaces or the insulation thereof, in which the temperatures contemplated are 0°C or below, are to be not less than 65 mm bore. The pipework is to be in accordance with the requirements of *Pt 5, Ch 12 Piping Design Requirements* and *Pt 5, Ch 13, 2.9 Miscellaneous requirements*.

4.18.2 Sounding pipes to oil compartments are not to terminate within refrigerated spaces or in their air cooler spaces, or are these pipes to terminate in enclosed spaces from which access is provided to refrigerated spaces or their air cooler spaces.

4.18.3 All pipes, including scupper pipes, air pipes and sounding pipes that pass through refrigerated spaces are to be insulated.

4.18.4 Where the pipes referred to in *Pt 6, Ch 3, 4.18 Piping in way of refrigerated spaces 4.18.3* pass through chambers intended for temperatures of 0°C or below, they are also to be insulated from the steel structure, except in positions where the temperature of the structure is mainly controlled by the external temperature and will normally be above freezing point. Pipes passing through a deck plate within the ship side insulation, where the deck is fully insulated below and has an insulation ribband

on top, are to be attached to the deck plating. In the case of pipes adjacent to the shell plating, metallic contact between the pipes and the shell plating or frames is to be avoided so far as practicable.

4.18.5 The air refreshing pipes to and from refrigerated spaces need not, however, be insulated from the steelwork.

4.19 Drainage from refrigerated spaces

4.19.1 Provision is to be made for the continuous drainage of the inside of all refrigerated spaces and cooler trays. The pipework is to be in accordance with the requirements of *Pt 5, Ch 12 Piping Design Requirements* and *Pt 5, Ch 13, 3.2 Cargo holds*.

4.19.2 All drain pipes from the refrigerated spaces and cooler trays are to be fitted with liquid sealed traps, which are to be of adequate depth and readily accessible for cleaning and refilling with brine. The pipes from lower spaces situated on the tank tops are also to be fitted with bilge non-return valves.

4.19.3 Where drains from separate refrigerated spaces join a common main, the branch pipes are each to be provided with a liquid sealed trap.

4.19.4 Sluices, scuppers or drain pipes which would permit drainage from compartments outside the refrigerated spaces into the bilges of the latter are not to be fitted.

4.19.5 Screwed plugs or other means for blanking off scuppers, draining chambers and cooler trays are not to be fitted. If, however, it is specially desired to provide means for temporarily closing these scuppers, they may be fitted with shut-off valves.

4.20 Corrosion protection of metal fixtures

4.20.1 All steel bolts, nuts, hangers, brackets and fixtures which support or secure cooling appliances, piping insulation, meat rails, linings and prefabricated insulated panels, etc. are to be suitably protected against corrosion.

4.21 Pressure testing at manufacturers' works

4.21.1 Components intended for use with a primary refrigerant are to be subject to strength and leak pressure tests as detailed in *Table 3.4.2 Test pressure*.

Table 3.4.2 Test pressure

Component	Test pressure, MPa g	
	Strength test	Leakage test
1. Pressure vessels	<i>See Pt 5, Ch 11 Other Pressure Vessels</i>	1,0p
2. Compressor cylinders/crankcase/casing	1,5p	1,0p
3. Valves & fittings	2,0p	1,0p
4. Pressure piping, fabricated headers, air coolers, etc.	1,5p	1,0p
Note p is the design pressure as defined in <i>Pt 6, Ch 3, 2.5 Design pressures</i> .		

4.21.2 Component strength pressure tests are to be hydraulic or where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.

4.21.3 Component leakage pressure tests are to be carried out only after completion of satisfactory strength pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.

4.21.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure, but in no case less than 0,35 MPa g.

4.22 Pressure test after installation on board ship

4.22.1 For primary refrigerant piping welded in place, strength pressure tests of the welds are to be carried out at a test pressure of 1,5p. This will normally take the form of a pneumatic test since hydraulic testing media such as water are not

acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.

4.22.2 Pneumatic pressure tests are to be carried out using a suitable inert gas. All pneumatic tests are potentially dangerous and due precautions are to be observed.

4.22.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by *Pt 6, Ch 3, 4.22 Pressure test after installation on board ship 4.22.2* may be omitted provided non-destructive tests by ultrasonic or radiographic methods are carried out with satisfactory results on the entire circumference of all butt welds not tested in accordance with *Pt 6, Ch 3, 4.11 Piping systems 4.11.3*. Where ultrasonic tests have been carried out, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have a prejudicial effect on the service performance of the piping.

4.22.4 After completion of the test required by *Pt 6, Ch 3, 4.22 Pressure test after installation on board ship 4.22.1*, *Pt 6, Ch 3, 4.22 Pressure test after installation on board ship 4.22.2* or *Pt 6, Ch 3, 4.22 Pressure test after installation on board ship 4.22.3*, a leak pressure test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the Surveyor.

4.22.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure, but in no case less than 0,35 MPa g.

■ **Section 5** **Refrigerant detection systems**

5.1 General

5.1.1 A fixed refrigerant detection system is to be provided in the refrigerating machinery compartment or space, the discharge pipes from pressure relief valves, ventilation outlet ducts, and the cargo chambers, where appropriate.

5.1.2 The alarm system is to comply with the requirements of *Pt 6, Ch 1 Control Engineering Systems* and, as a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and a high-level concentration corresponding to the refrigerant's safe occupational level.

5.1.3 Detection equipment is to be so designed that it may be readily tested and calibrated, and failure of the equipment is to initiate an alarm.

5.1.4 The location of the detectors is to be determined relative to the layouts of the individual compartments and machinery spaces and are to be indicated on the plan submission.

5.1.5 For carbon dioxide systems, spaces such as machinery rooms, storage compartments, production areas on fishing vessels and valve stations, where leakage may occur, are to be fitted with detectors. Welded pipelines passing through passageways or access ducts are not considered possible leakage areas.

5.1.6 Audible and visual alarms are to be activated, located both inside and outside the affected space. The alarms are to be readily identifiable and be visible and audible in all locations within the space housing the refrigeration equipment.

5.2 Ammonia vapour detection and alarm equipment

5.2.1 A fixed detector system for ammonia is to comply with the requirements contained in *Pt 6, Ch 3, 5.2 Ammonia vapour detection and alarm equipment 5.2.2*.

5.2.2 The location of the detectors is to be determined relative to the layouts of the individual spaces and are to be indicated on the plan submission required by *Pt 6, Ch 3, 1.2 Plans and particulars*.

5.2.3 Ammonia vapour detectors are to be provided in the refrigeration machinery compartment, associated access ways, the exhaust duct, the ammonia store room and the discharge pipes from pressure relief valves.

5.2.4 Sufficient detectors are to be provided to monitor the total areas of the above spaces.

5.2.5 For vapour detection in relief valve discharge pipes, see *Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.4*.

5.2.6 Details of the refrigerant detector set points and operational philosophy are to be submitted for consideration.

■ **Section 6** **Electrical installation**

6.1 General

6.1.1 Where the refrigerating machinery is to be electrically driven, the requirements of *Pt 6, Ch 2, 2 Main source of electrical power* are to be complied with, as applicable.

6.1.2 The generating capacity available for the refrigerated installation is to be sufficient to supply power to the installation during cooling down of a complete cargo to, and maintenance of, the notation temperature conditions in all refrigerated spaces at the Rule maximum ambient and sea-water temperatures.

6.1.3 Electrical equipment is not to be installed in spaces in which ammonia refrigerant is used or stored unless it is essential for operational purposes. Where electrical equipment is installed in such spaces the requirements of *Pt 6, Ch 3, 6.2 Electrical equipment for use in explosive gas atmospheres* are to be complied with.

6.2 Electrical equipment for use in explosive gas atmospheres

6.2.1 Lighting fittings are to be of a certified safe-type and be arranged on at least two independent final branch circuits. Switches and protective devices are to interrupt all lines or phases and are to be located outside the space.

6.2.2 Where electric motors driving ventilation fans are located within the spaces, within ventilation ducts, or within three metres of ventilation openings, they are to be of a certified safe-type.

6.2.3 Monitoring control and alarm systems which are required to operate under conditions of ammonia leakage are to be of a certified safe-type.

6.2.4 Electrical equipment which is not of a certified safe-type is to de-energise automatically if the ammonia concentration within the space exceeds 1,0 per cent by volume.

■ **Section 7** **Instrumentation, control, alarm, safety and monitoring systems**

7.1 Instrumentation

7.1.1 All compressors are to be provided with the following instrumentation and automatic shutdowns:

- Indication of suction pressure (saturated temperature), including intermediate stage, when applicable.
- Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
- Indication of lubricating oil pressure.
- Indication of cumulative running hours (screw compressors).
- Automatic shutdown in the event of low lubricating oil pressure.
- Automatic shutdown in the event of high discharge pressure, *see also Pt 6, Ch 3, 4.15 Overpressure protection devices 4.15.7.*
- Automatic shutdown in the event of low suction pressure.

7.1.2 The automatic safety equipment is to be designed to fail safe and the arrangements are to be such that the compressors can be operated manually with the equipment out of action, in accordance with the relevant requirements of *Pt 6, Ch 1 Control Engineering Systems*.

7.1.3 For installations greater than 25 kW the following instrumentation, additional to that required by *Pt 6, Ch 3, 7.1 Instrumentation 7.1.1*, is to be provided:

- Indication of lubricating oil temperature.
- Indication of cooling water outlet temperature.
- Indication of cumulative running hours (reciprocating compressors).
- Indication of suction and discharge temperatures.

7.2 Control, alarm and safety systems

7.2.1 Where the refrigerating system is fitted with automatic or remote controls, so that under normal operating conditions no manual intervention by the operators is required, it is to be provided with the alarms required by *Pt 6, Ch 3, 7.2 Control, alarm and safety systems 7.2.2* and *Pt 6, Ch 3, 7.2 Control, alarm and safety systems 7.2.3* in accordance with the relevant requirements of *Pt 6, Ch 1 Control Engineering Systems*.

7.2.2 Alarms are to be initiated in the event of the following compressor fault conditions:

- High discharge pressure.
- Low suction pressure.
- Low oil pressure.
- High discharge temperature.
- High oil temperature.
- Motor shutdown.

7.2.3 Alarms are also to be initiated in the event of the following fault conditions:

- Failure of condenser cooling water pumps.
- High condenser cooling water outlet temperature.
- Failure of air cooler fans.
- High and low refrigerated air delivery temperatures.
- High secondary refrigerant temperatures.
- Failure of secondary refrigerant pump.
- Failure of air refreshing fans.
- Low level in secondary refrigerant header tank.

7.3 Temperature monitoring and recording

7.3.1 Temperature sensors are to be of a type which has been approved by LR. The number of sensors and their locations are to be such as to give a true measurement of the temperatures within the refrigerated spaces and of the cooler delivery and return air temperatures.

7.3.2 At least one automatic recorder is to be provided for the remote monitoring and continuous recording of air temperatures within the refrigerated spaces, and delivery and return air temperatures of individual air coolers. Where only one recorder is installed, at least one sensor in each refrigerated space or in its air distribution system is to be connected to a separate remote temperature indicating instrument.

7.3.3 Where the equipment controlling the temperature of the air delivered from the air coolers is equipped with a temperature indicator, this indicator will be given consideration as a standby instrument.

7.3.4 In the case of freezer fishing vessels, where the catch is frozen on board and stored in a refrigerated space, thermometer(s) hung within each space(s) will be accepted as the standby temperature indicator, provided the space is accessible at all times.

7.3.5 Automatic temperature recorders and temperature indicators are to be of a type which has been approved by LR and, where appropriate, are to be in accordance with the requirements of *Pt 6, Ch 1 Control Engineering Systems*. Approval will be granted on the basis of compliance with *Pt 6, Ch 3, 7.3 Temperature monitoring and recording 7.3.6* and *Pt 6, Ch 3, 7.3 Temperature monitoring and recording 7.3.7*, together with satisfactory environmental testing in accordance with the requirements of LR's Type Approval System. This is to include low temperature testing at the class notation minimum temperatures for any components which may be installed in environments subject to temperatures below ambient.

7.3.6 All temperature instrumentation is to be accurate to within $\pm 0,15^{\circ}\text{C}$ of the true temperature in the range minus 3°C to plus 15°C , and to $\pm 0,3^{\circ}\text{C}$ in other parts of the range and is to register to 0,1 of a degree Celsius.

7.3.7 Where the installation is intended for the carriage of frozen cargo only, the readings need only be accurate to within $\pm 0,5^{\circ}\text{C}$ of the true temperature, throughout the range.

7.3.8 A spirit-in-glass thermometer is to be carried on board for checking purposes, which is to be calibrated to a recognised National Standard.

7.3.9 Thermometer tubes with their flanges and covers are to be insulated from the deck plating, and on weather decks they are to be so arranged that water will not run down the tubes when temperatures are being taken.

7.3.10 The inside diameter of thermometer tubes is to be not less than 50 mm, and the tubes are not to be in contact with cold decks.

7.3.11 Where thermometer tubes pass through compartments other than those which they serve, they are to be efficiently insulated.

■ *Section 8* **Personnel safety equipment and systems**

8.1 Personnel safety equipment

8.1.1 Access doors, and hatches to the refrigerated spaces and air cooler spaces are to be provided with an external locking arrangement.

8.1.2 Access ways to the refrigerated space are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.

8.1.3 Access ways and air cooler spaces are to be provided with an independent lighting system in accordance with the requirements of *Pt 6, Ch 2, 5.7 Lighting circuits 5.7.2* and *Pt 6, Ch 2, 5.7 Lighting circuits 5.7.4*, with the means of locking the switches in the 'on' position.

8.1.4 Where ammonia is used in refrigerating systems, the following items of safety equipment are to be provided as a minimum, and positioned in accessible protected storage (e.g. locked glass fronted cabinets) located outside the machinery compartment:

- Two sets of ammonia protective clothing (including helmet, boots and gloves).
- Two portable battery powered hand lamps (to be of certified safe-type).
- Two sets of self-contained breathing apparatus (compressed air).
- Two full face mask respirators.
- Two fire-resistant life-lines.
- Two firemen's axes.
- Two heavy duty adjustable spanners.
- Two wheel wrenches.
- Irrigation facilities or eye wash bottles containing an eye wash solution, distilled water or non-carbonated mineral water.
- Hand or foot-operated douches providing a copious supply of clean water, located outside the compartment's doors. See *Pt 6, Ch 3, 3.2 Arrangements for compartments housing machinery using ammonia 3.2.4*.

8.2 Personnel warning systems

8.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.

8.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the Surveyors must indicate their well-being by accepting the warning.

8.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.

8.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.

8.2.5 In the event that the crew member(s) fails to respond and accept the warning within an agreed specified time, the system is to immediately initiate an alarm on the bridge and in the engineers' accommodation. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.

8.2.6 The system is to comply with the relevant requirements of *Pt 6, Ch 1 Control Engineering Systems*.

■ Section 9

Refrigerated cargo spaces

9.1 Airtightness of refrigerated spaces

9.1.1 The envelopes of individual refrigerated spaces, enclosing each temperature zone, are to be sufficiently airtight to prevent infiltration of water vapour and cross-contaminating odours. Each envelope is to be hose-tested for tightness before the insulation is installed. Alternative proposals to test with gas or air under pressure will be considered.

9.1.2 Hatch closing appliances, access doors, side loading doors, bilge and manhole plugs forming part of an insulated envelope are to be made airtight and, where exposed to ambient conditions, are to be provided with a double seal.

9.1.3 Ventilators, ducts or pipes passing through refrigerated spaces to other compartments are to be made airtight and efficiently insulated. Particular attention is to be given to insulation linings forming surfaces of air ducts. Ventilators to refrigerated spaces, if fitted, are to be provided with airtight closing appliances.

9.1.4 Refrigeration pipes passing through bulkheads or decks of refrigerated chambers or spaces are not to be in direct contact with the steelwork. The temperature of the ship's steelwork close to low temperature refrigeration piping must not be lower than that acceptable for the steel grade, see also Pt 3, Ch 2, 2.2 *Refrigerated spaces*. The airtightness of the bulkheads and decks is to be maintained and, where the pipes pass through watertight decks and bulkheads, the fittings and packing of the glands are to be both fire resisting and watertight.

9.2 Insulation systems

9.2.1 Steelwork and fittings are to be clean and dry, and suitably coated to prevent corrosion, before insulation is applied.

9.2.2 *In situ* insulation and insulating panels are to be of a type that has been approved by LR and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the *Procedure for LR Type Approval System* will be supplied on application. Prefabricated panels, with an organic foam core and metal or similar cladding both sides, are also to be manufactured under survey at a works approved by LR. Organic foam materials are to be certified as self-extinguishing. All materials are to be free from odour likely to cause taint.

9.2.3 The thickness of insulation over all surfaces and the manner in which it is supported are to be in accordance with the approved specification and plan.

9.2.4 The insulation is to be efficiently packed and, where it is of slab form, the joints are to be butted closely together and staggered. Where it is intended to use a foamed *in situ* type of insulation, full details of the process are to be submitted for approval before the work commences and pre-production testing on site is to be carried out to the satisfaction of the Surveyor, using a 'mock-up' representative of the system to be employed. Prefabricated panels are to be of a design such that, when erected, continuity of the insulation envelope is maintained without any gaps. Gaps between panels or insulation slabs are to be filled with insulating material to the satisfaction of the Surveyor.

9.2.5 The inner surfaces of insulation envelopes are to be clad with a suitable lining, such as marine grade aluminium or plywood, or equivalent material which is:

- impermeable;
- able to withstand wear and tear and the flexing of the ship's structure without fracture at the notation temperatures;
- non-corrosive, non-rotting; and
- free from odour likely to cause taint.

Where prefabricated panels are employed the outer surfaces are also to be clad with a suitable lining.

9.2.6 Insulation linings are to be constructed and fitted so that they are airtight and provide an effective vapour barrier. The means of joining prefabricated panels are to have sufficient mechanical strength to maintain a vapour barrier on the inner and outer faces. All joints, including corner, deck, deckhead and tank top intersections are to be sealed with a suitable flexible, water vapour resistant sealant or gasket. Special care is necessary where air ducts are embedded in the insulation, and where refrigeration pipes, air refreshing ducts, fan supports, fixtures, etc. protrude through the linings.

9.2.7 Hatch covers and plugs, access doors, manhole plugs, bilge limbers and plugs forming part of the insulated envelope are to be constructed of, or covered with, a suitable lining material.

9.2.8 Insulation linings and air screens, together with supports, are to be strong enough to withstand the loads imposed by either refrigerated or general cargo.

9.2.9 Successive coatings impervious to oil are to be applied before insulating the exposed plating of tank tops and bulkheads protecting tanks containing oil. The total thickness of the required coating will depend on the construction of the tank, the composition of the coating used and the method of application.

9.2.10 If the cargo to be loaded on the tank top insulation could cause damage to the lining, then additional protection is to be provided in way of the hatch and 0,6 m beyond. The protection may be of either a permanent or temporary nature.

9.2.11 Where the insulation is to support fork lift trucks, the strength of the lining and its supports is to be demonstrated. A sample of the insulation, approximately 4 m × 4 m, is to be prepared and tested by a fully loaded fork lift truck with a gross weight of 6,5 tons on one axle with a wheel pitch of 1450 mm, having single wheeled pneumatic tyres. The truck is to be driven and manoeuvred over the sample to the satisfaction of the Surveyors.

9.2.12 Prefabricated panel systems are to be fitted with suitable pressure equalising devices to prevent damage which may be caused by under or over pressure resulting from the defrosting of coolers, rapid changes in pressure on the inner and outer faces of the panels or rapid cooling of the chamber.

9.2.13 The pressure equalising devices are to be so designed as to allow the passage of air in either direction, but remain effectively closed until the pressure differential reaches a value of 10 mm water column. Heating is to be provided to protect the mechanism from freezing.

9.3 Access plugs and panels

9.3.1 Insulated plugs are to be provided in the insulation where required for easy access to the bilges, bilge suction strum boxes, cooler and chamber drains and tank manhole lids. Removable panels are to be provided for access to tank air and sounding pipes and drains.

9.3.2 Tank top insulation in way of manholes and bilge hats is to be provided with a liquid-tight steel coaming to prevent seepage into the insulation.

9.3.3 Manholes are not permitted in the bulkheads of fuel oil tanks which form part of the cargo space envelope.

9.4 Air circulation and distribution

9.4.1 When frozen cargo is carried, provision is to be made for the adequate circulation of air between the frozen cargo and all the insulation lining surfaces.

9.4.2 When cooled cargo is carried, of a type which may generate heat or emit gas, provision is to be made for the adequate circulation of air through all the stow.

9.4.3 There is to be adequate air flow between cargo and cooling grids, where fitted.

9.4.4 The air distribution arrangements are to be such that the required circulation rate and uniform distribution can be achieved when the space is part or fully loaded with cargo. The arrangement is also to be capable of maintaining uniform air temperature throughout the space with any one fan, or air cooler, or cooling grid circuit out of action, *see Pt 6, Ch 3, 4.8 Air coolers and cooling grids*.

9.5 Air refreshing arrangements

9.5.1 Where spaces are intended for the carriage of refrigerated cargoes requiring controlled ventilation, means are to be provided for air refreshing. The positions of the air inlets are to be carefully selected to minimise the possibility of contaminated air entering the spaces. Chambers or spaces are to be provided with separate inlet and discharge vents. Each vent is to have a positive airtight valve capable of closing onto a seat. It is recommended that a distance of at least 3 m is maintained between inlet and exhaust vents.

9.6 Heating arrangements for fruit cargoes

9.6.1 Where the class notation includes the symbol ‡ for the carriage of fruit cargoes, facilities for heating the refrigerated spaces are to be provided to maintain the carrying temperatures when the temperatures outside the spaces are lower.

■ *Section 10***Container ships fitted with refrigerating plant to supply cooled air to insulated containers in holds****10.1 General**

10.1.1 Classed installations designed to supply refrigerated air to insulated 'porthole' containers in holds aboard container ships are to comply with the requirements of *Pt 6, Ch 3, 1 General requirements* to *Pt 6, Ch 3, 9 Refrigerated cargo spaces* and *Pt 6, Ch 3, 11 Acceptance trials*, so far as they are applicable, and the special requirements of this Section.

10.1.2 The classed refrigerating installation is to include the refrigerating machinery, air coolers, supply and return air ducting, and the flexible couplings between containers and the duct system. Where the arrangements are such that cell air conditioning is essential to the carriage of the containers, the air conditioning equipment and (if fitted) the insulation of the hold, deckheads, sides and tank tops are to be included in the classification.

10.2 Additional information and plans

10.2.1 In addition to those requirements detailed in *Pt 6, Ch 3, 1 General requirements* which are also applicable to refrigerated container ships, the following information is to be submitted before the work commences:

- Details of air coolers.
- Details of the design of ducting proposed, including joints, connections, insulation, vapour sealing and linings.
- Details of cell air conditioning arrangements and components.
- Details of couplings between ducting and containers, including operating arrangements.

10.3 Air coolers

10.3.1 Air ducts supplying more than ten standard 20 ft containers or five standard 40 ft containers are to have a single air cooler with multiple circuits or two independent coolers. The individual circuits or coolers are to be provided with stop valves so that each circuit or cooler may be readily isolated.

10.3.2 The refrigeration capacity of the air cooler arrangement is to be such that the temperature conditions can be maintained with any one circuit or independent cooler out of action.

10.3.3 For air ducts supplying ten standard 20 ft containers or five standard 40 ft containers or less, a single cooler with one circuit will be acceptable.

10.4 Air duct systems

10.4.1 The air ducts, together with all branches and couplings, supplying refrigerated air to insulated containers in holds, are to be made airtight. For design purposes, however, an air leakage rate of 0,5 per cent of total volume flow at the design pressure for each duct is to be taken.

10.4.2 Where air ducting is insulated on the internal surfaces, provision is to be made to prevent retention of odour which may taint subsequent cargo.

10.4.3 Couplings are to be of a type that has been approved by LR. Prototypes are to be tested under all operating conditions, witnessed by the Surveyors, to demonstrate that they extend, retract and separate satisfactorily from a 'container end wall' at the minimum temperature condition. When operated by means of air pressure they are to be supplied with air sufficiently dry to avoid ice formation. The air supply lines are to be strength pressure tested to $1,5 \times$ design pressure.

10.5 Duct air leakage and distribution tests

10.5.1 Air leakage tests on at least 10 per cent of ducting, selected at random, are to be carried out to the satisfaction of the Surveyors before the insulation is applied. The Surveyors may require further testing to demonstrate airtightness of ducting. The air leakage from each duct will depend on several factors and, while complete airtightness should be the objective, the air leakage rate for design purposes is not to exceed 0,5 per cent of total volume flow at the design pressure of 250 Pa.

10.5.2 In the case of prefabricated ducts, the prototype is to be subjected to air distribution, heat leakage and air leakage tests. Each production duct is to be tested for air leakage and is not to exceed the prototype test results by more than five per cent.

Additionally, one duct in 50 or part thereof is to be tested for heat leakage and the results are not to exceed the prototype test results by more than 10 per cent.

10.5.3 In all cases when prefabricated sections are assembled on board, the tests as detailed in *Pt 6, Ch 3, 10.5 Duct air leakage and distribution tests 10.5.2*, are to be carried out aboard the ship.

10.5.4 On application from the Owner, the air leakage tests on air ducts installed aboard the ship, as detailed in *Pt 6, Ch 3, 10.5 Duct air leakage and distribution tests 10.5.1*, may be omitted provided that:

- the installation is designed with at least 20 per cent surplus refrigerating capacity, or
- assignment of a temperature notation for the installation be deferred until verified by a thermal balance test to the Surveyor's satisfaction.

10.5.5 All ducts are to be tested for air distribution to the containers, at the manufacturer's works, by measuring the flow of air from the supply couplings while the fan is operated at full speed against the designed pressure. The air flow at each coupling is to meet the specified figure within ± 5 per cent.

10.5.6 Systems comprising rigid prefabricated ducts complete with coolers and fans are to be tested for air distribution at the place of manufacture. The remaining tests are to be carried out aboard the ship.

10.6 Cell air-conditioning arrangements

10.6.1 The cell air-conditioning equipment and ducting, and/or insulation of the holds, deckheads, sides and tank tops, is to be such as to maintain a uniform temperature throughout the cell and to ensure the ship's steelwork is maintained above the minimum temperature acceptable for the steel grade, *see also Pt 3, Ch 2, 2.2 Refrigerated spaces*.

■ **Section 11** **Acceptance trials**

11.1 Tests after completion

11.1.1 On completion of construction, the acceptance tests prescribed in *Pt 6, Ch 3, 11.3 Acceptance tests 11.3.1* are to be carried out to verify the correct functioning of the installation and its ability to maintain the lowest notation temperature conditions required for the assignment of the intended class notation. The proposed test schedules, which should include methods of testing and test facilities provided, are to be submitted for approval before these acceptance tests are started.

11.2 Thermographic survey

11.2.1 The insulated envelope of refrigerated cargo ships and, where applicable, fish factory ships, fishing vessels, fruit juice carriers and container ships is to be scanned using a thermal imaging camera. The main purpose of carrying out the infra-red scan is to verify the efficiency of the insulation system.

11.2.2 During the course of, or prior to, the acceptance trials all inner insulated surfaces, including tank tops, bulkheads, 'tween decks, insulated hatches, coamings and weather decks are to be subject to an infra-red scan.

11.2.3 Where internal obstructions preclude an internal scan, it is to be carried out externally.

11.2.4 The scan is to be conducted with the 'tween deck and main holds in total darkness and with air coolers/cooling grids isolated and all heat sources disconnected. The temperature difference, cargo hold to ambient air or sea-water temperature, is to be 15 K or more.

11.2.5 Any deficiencies or abnormalities revealed are to be investigated and repaired to the extent considered necessary by the Surveyor.

11.3 Acceptance tests

11.3.1 The acceptance tests (*see also Pt 6, Ch 3, 11.3 Acceptance tests 11.3.2 and Pt 6, Ch 3, 11.3 Acceptance tests 11.3.3*) are to comprise the following:

- (a) Verification of control, alarm, safety and refrigerant detection systems.

- (b) Test simulating failure of selected components such as compressors, fans and pumps, to verify correct functioning of alarm and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control, monitoring and recording instrumentation.
- (d) Verification of air cooler fan outputs running at maximum speed, and air circulation rates and distribution arrangements in individual refrigerated spaces or chambers. The latter is to be undertaken firstly with all coolers in operation and secondly with any one cooler or fan out of action.
- (e) Verification of air refreshing and heating arrangements.
- (f) Verification of personnel safety devices and warning systems in refrigerated spaces.
- (g) Refrigeration and thermal balance tests to demonstrate the capability of the combined refrigerating plant and insulation envelope to maintain the lowest notation temperature to be assigned.
- (h) Refrigeration tests for refrigerated container ships carrying 'porthole' type insulated containers. If the prescribed thermal balance tests cannot be carried out due to the number of insulated containers available in the shipyard being inadequate, then, alternatively, the following separate tests will be accepted:
 - (i) Compressor capacity test.
 - (ii) Duct heat leakage test on at least 20 per cent of the insulated ducting selected at random.
 - (iii) Cell heat leakage test.
- (i) Thermographic scan to be carried out as required by *Pt 6, Ch 3, 11.2 Thermographic survey*.

11.3.2 Where a number of identical installations are constructed for the same Owner and by the same shipyard, the refrigeration and thermal balance tests required in *Pt 6, Ch 3, 11.3 Acceptance tests 11.3.1.(g)*, need only be carried out on two of the series, provided the results are satisfactory.

11.3.3 Where the cells of 'porthole' type insulated containers are not insulated, a heat leakage test will be required on the first ship of the series only.

11.4 Sea trials

11.4.1 Where the class notation includes the symbol ‡ for the carriage of fruit, or the symbol ‡ is to be assigned to a fishing vessel the following records are to be kept during the first loaded voyage:

(a) **Refrigerated cargo or container ships:**

Refrigerating machinery logs and temperature records for the refrigerated cargo spaces or containers, demonstrating the installation's capability to cool down the full cargo of fruit and maintain the notation temperature conditions.

(b) **Fishing vessels:**

Refrigerating machinery and freezing equipment logs and temperature records for the refrigerated cargo spaces, demonstrating the installation's capability to freeze the catch and maintain the notation temperature conditions.

11.5 Reporting of tests

11.5.1 On completion of the tests prescribed in *Pt 6, Ch 3, 11.1 Tests after completion*, two copies of the test schedule for the refrigerated cargo installation, giving details of all recorded data and thermal heat balance results, signed by the Surveyor and Builder are to be provided. One copy is to be placed on board the ship and the other submitted to LR.

11.5.2 At the end of the first loaded voyage a copy of the logs and temperature records requested in *Pt 6, Ch 3, 11.4 Sea trials 11.4.1.(a)* and *Pt 6, Ch 3, 11.4 Sea trials 11.4.1.(b)*, as applicable, signed by the ship's Chief Engineer, are to be submitted to LR.

Fire Protection, Detection and Extinction Requirements

Part 6, Chapter 4

Section 1

Section

1 General

2 Fire detection, protection and extinction

■ Section 1 General

1.1 Application

1.1.1 Cargo ships of 500 gross tons or more, all passenger ships and gas and chemical tankers on international voyages, where provision is made within International Conventions, are to be provided with the fire safety measures required by the *International Convention for the Safety of Life at Sea*, 1974, as amended (SOLAS - *International Convention for the Safety of Life at Sea*). Fishing vessels of 45 m freeboard length and over are to be provided with the fire safety measures required by the Torremolinos Protocol of 1993 relating to the *Torremolinos International Convention for the Safety of Fishing Vessels*, 1977 (Torremolinos Protocol).

1.1.2 Cargo ships of 500 gross tons or more, all passenger ships, and gas and chemical tankers, employed on national voyages are to comply with the fire safety measures prescribed and approved by the Government of the Flag State.

1.1.3 It is the responsibility of the Government of the Flag State to give effect to the fire protection, detection and extinction requirements of *Pt 6, Ch 4, 1.1 Application 1.1.1* and *Pt 6, Ch 4, 1.1 Application 1.1.2*. However, Lloyd's Register (hereinafter referred to as 'LR') will undertake to do this in cases where:

- (a) contracting Governments have authorised LR to apply the requirements of *SOLAS - International Convention for the Safety of Life at Sea* or the Torremolinos Protocol and issue the appropriate certification on their behalf; or
- (b) the Government of the Flag State is not a signatory to *SOLAS - International Convention for the Safety of Life at Sea* or the Torremolinos Protocol; or
- (c) the ship or fishing vessel is to be classed for restricted or special service in national waters for which the Government of the Flag State has no national requirements. In such cases, LR will apply the fire safety measures required by *SOLAS - International Convention for the Safety of Life at Sea* or the Torremolinos Protocol, as appropriate.

However, due consideration will be given to arrangements deemed to provide an equivalent level of fire safety, taking due cognisance of the circumstances of the restricted or special service.

1.1.4 *Pt 6, Ch 4, 2 Fire detection, protection and extinction* of this Chapter, which is within the spirit of the International Convention and Protocol requirements for ships of Convention size, is applicable to cargo ships of less than 500 gross tons (where not covered by International Conventions), fishing vessels of 12 m registered length and over but less than 45 m freeboard length, and ships not fitted with propelling machinery.

1.1.5 Consideration will be given to the acceptance of fire safety measures prescribed and approved by the Government of the Flag State in lieu of *Pt 6, Ch 4, 1.1 Application 1.1.4*.

1.1.6 Special consideration, consistent with the fire hazard involved, will be given to construction or arrangement features not covered by this Chapter.

1.1.7 Cargo ships of less than 500 gross tons intended for the carriage of dangerous goods are to comply with SOLAS 1974 as amended *Regulation 19 - Carriage of dangerous goods*¹.

Fire Protection, Detection and Extinction Requirements

Part 6, Chapter 4

Section 2

■ Section 2 Fire detection, protection and extinction

2.1 General provisions

2.1.1 The provisions of these requirements, are intended to apply to new and, as far as reasonable and practicable, or as found necessary by the relevant Administration, to existing cargo ships of less than 500 gt.

2.1.2 It should be remembered that the *IBC Code - International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk* Amended by Resolution MEPC.225(64) and 2014 *IGC Code - International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk* are applicable to such ships regardless of size including those of less than 500 gt.

2.2 Definitions

2.2.1 The terms, used in these requirements are as defined in *SOLAS - International Convention for the Safety of Life at Sea 1974* (as amended).

2.2.2 The term Gross Tonnage (gt) is as defined in IMO Resolutions A.493 (XII), calculated in accordance with the 1969 Tonnage Convention and the interim scheme applicable to ships with keels laid up to 18 July 1994 in accordance with IMO Resolution A.494 (XII).

2.2.3 Service area definitions

2.2.4 'Unrestricted service' means a ship engaged on international voyages.

2.2.5 'Restricted service' is broken down into two broad categories (a) ships operating coastal or specified operating areas (b) ships operating within protected or extended protected waters.

- (a) **Specified coastal service.** Service along a coast, the geographical limits of which are to be defined and for a distance out to sea generally not exceeding 20 nautical miles, unless some other distance is specified for 'coastal service' by the Administration with which the ship is registered, or by the Administration of the coast off which it is operating. A typical example might be 'Indonesian coastal service'.

Specified operating or service areas may be service between two or more ports or other geographical features, or service within a defined geographical area such as 'Red Sea Service', 'Piraeus to Thessaloniki and Islands within the Aegean Sea'.

- (b) **Protected water service.** Service in sheltered water adjacent to sand banks, reefs, breakwaters to other coastal features, and in sheltered water between islands.

Extended protected water service. Service in protected waters and also short distances (generally less than 15 nautical miles) beyond protected waters in 'reasonable weather'.

2.3 Surveys and maintenance

2.3.1 The hull, machinery and all equipment required for safety aspects of every ship should be constructed and installed so as to be capable of being regularly maintained to ensure that they are at all times, in all respects, satisfactory for the ship's intended service.

2.3.2 A competent authority should arrange for appropriate surveys of the required equipment relating to fire safety aspects during construction and, at regular intervals after completion, generally as prescribed within Chapter I of *SOLAS - International Convention for the Safety of Life at Sea* (as amended). Such surveys should be carried out by the Society classing the ship or the Flag State.

2.3.3 The condition of the structural fire protection and fire safety related equipment shall be maintained to conform with the provisions of the requirements to ensure that the ship, in these respects, will remain fit to proceed to sea without danger to the ship or persons on board. The hull structure and machinery do not form part of these requirements but should be similarly surveyed and maintained.

2.4 Requirements

2.4.1 *Table 4.2.1 General fire detection, protection and extinction requirements* details the various minimum fire protection, detection and extinction arrangements that are required depending on the vessel's intended service area.

Fire Protection, Detection and Extinction Requirements

■ *Section 1* **General requirements**

1.1 General

1.1.1 The requirements of this Chapter apply to refrigerated cargo ships where a Controlled Atmosphere (**CA**) notation is requested.

1.1.2 The requirements are additional to the classification requirements for refrigerated cargo installations contained in *Pt 6, Ch 3 Refrigerated Cargo Installations*.

1.1.3 Ships provided with CA systems which are approved, installed and tested in accordance with the following requirements will be eligible for the applicable class notation specified in *Pt 1, Ch 2, 2.6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC)) 2.6.2*.

1.1.4 An example of a typical class notation on a refrigeration installation classed with Lloyd's Register (hereinafter referred to as 'LR'), fitted with a CA system built under Special Survey, would be:

⊠ **Lloyd's RMC** to maintain a temperature -29°C to +14°C with sea temperature 35°C maximum.

⊠ **CA (1-12% O₂, 0-25% CO₂) RH**

1.2 Novel arrangements and design

1.2.1 Where the proposed construction of the CA system, or CA zones, is novel in design, or involves the use of unusual materials or equivalent arrangements to those specified in the following sections, special tests may be required, and a suitable descriptive note may be assigned.

1.3 Definitions

1.3.1 **CA zone** means one or more cargo chambers enclosed in an air-tight envelope.

1.3.2 **Gas** means a suitable gaseous mixture to retard the metabolic process of fresh products.

1.3.3 **Gas system** means a system which controls the levels of oxygen and/or carbon dioxide.

1.3.4 **Adjacent space** means an enclosed space adjoining a CA zone separated by watertight bulkheads or decks penetrated by pipes, cables, ducts, doors, 'tween deck, etc.

■ *Section 2* **Plans and documentation**

2.1 Plans of CA zones and adjacent spaces

2.1.1 The following plans and particulars of the CA zones and adjacent spaces are to be submitted in triplicate for approval before construction is commenced:

- (a) Capacity plan.
- (b) Location and installation of CA equipment.
- (c) Arrangement of CA zones in elevation and plan view.
- (d) Access arrangement.
- (e) Arrangement and use of spaces adjacent to CA zones.
- (f) Details of securing weather deck and 'tween deck hatch lids.
- (g) Details of securing gratings in way of hatch lids.
- (h) Details of weather deck and access hatch seals.
- (i) Door seals, scuppers, pipes, cables and ducts penetrating the decks, bulkheads, etc. together with proposed design conditions in the CA zones.
- (j) Specified leakage rate and proposals for its measurement.
- (k) Location of sampling points for CA gas and/or sensors in the CA zones and adjacent spaces.
- (l) Details of the gas supply piping system.
- (m) Details of gas freeing arrangements including fans, valves, ducts and any interlocks.
- (n) Details of pressure/vacuum valves for protecting devices in CA zones, location of outlets from P/V valves and capacity calculations.
- (o) Details of security locks provided on entry to the hatch and manhole covers, and doors leading to CA zones and adjacent spaces.
- (p) Arrangements of ventilation systems for the gas generator compartment and other adjacent spaces adjoining CA zones.

2.2 Gas supply system

2.2.1 The following plans and particulars of the gas supply system, etc. are to be submitted in triplicate for approval, before construction is commenced:

- (a) Schematic arrangements of the proposed gas supply systems and, where applicable, details of compressors, pressure vessels, membranes, storage tanks, gas cylinders, control and relief valves and safety arrangements, including pressure set points of alarm and safety devices.
- (b) Capacities of gas supply systems at different oxygen and carbon dioxide levels, if applicable.

2.3 Humidifiers

2.3.1 Where applicable, the following plans and particulars of the humidification system, etc. are to be submitted in triplicate for approval, before construction is commenced:

- (a) Specification and capacity of the system.
- (b) Principles of operation and control of relative humidities under different operating conditions.
- (c) Details of proposed equipment, nozzles, pads, heaters, pumps, steam generator, compressors, water tanks, etc.
- (d) Layouts of the equipment and the positioning of sensors and controls.

2.4 Control equipment

2.4.1 The following plans and details of the control, alarm and safety systems for CA zones, gas supply compartment and other adjacent spaces, are to be submitted in triplicate before construction is commenced:

- (a) Line diagrams of all control circuits.
- (b) List of monitored, control and alarm points.
- (c) Details of computer systems, if fitted.

- (d) Location of control panels and consoles.
- (e) Controls of all valves and dampers fitted to CA zones.
- (f) Details of oxygen and carbon dioxide analysers and arrangements for calibration.
- (g) Relative humidity (RH) sensors and details of calibration.
- (h) Details of alarm system, including location of central control panel and audible and visual warning devices.

2.5 Electrical

2.5.1 In addition to the applicable requirements of *Pt 6, Ch 2, 1.2 Documentation required for design review*, the following information and plans specific to the installed CA system are to be submitted in triplicate for approval, before construction is commenced:

- (a) Main power supply arrangement to the CA system.
- (b) Single-line diagram of the CA system which is to include rating of electrical machines, insulation type, size and current loading of cables and make, type and rating of protective devices.
- (c) A schedule of normal operating loads of CA system, estimated for the different operating conditions expected.

2.6 Testing

2.6.1 Details of the testing programme are to be submitted, including instrumentation to be used with range and calibration.

■ *Section 3*

CA zones and adjacent spaces

3.1 Air-tightness of CA zones

3.1.1 The CA zones are to be made air-tight in accordance with the requirements in *Pt 7, Ch 1, 9.3 Air-tightness of CA zones*. Particular attention is to be paid to sealing of hatches, plugs and access doors in each CA zone. Double seals are to be fitted to each opening.

3.1.2 Openings for pipes, ducts, cables, sensors, sampling lines and other fittings passing through the decks and bulkheads are to be suitably sealed and made air-tight.

3.1.3 The liquid sealed traps from bilges and drains from the cooler trays are to be deep enough to withstand, when filled with liquid which will not evaporate or freeze, the design pressure in each CA zone when taking account of the ship's motion.

3.1.4 Air refreshing inlets and outlets are to be provided with isolating arrangements.

3.2 CA zone protection

3.2.1 Means are to be provided to protect CA zones against the effect of overpressure or vacuum.

3.2.2 At least two P/V valves are to be fitted in each CA zone. They are to be set for the design conditions of the CA zone.

3.2.3 Consideration will be given to the use of a single valve in combination with other suitable means of overpressure or vacuum protection.

3.2.4 The proposed P/V valves for each zone are to be of adequate size to release any excess pressure and to relieve the vacuum at maximum cooling rate.

3.2.5 P/V valve discharges are to be located at least 2 m above deck and 10 m away from any ventilation inlets. Discharge piping is to be arranged to preclude ingress of water, dirt or debris which may cause the equipment to malfunction.

3.2.6 Pressure sensors are to be installed in locations necessary to monitor pressure of all CA zones. Pressure sensors are to be installed away from fans, air inlets and outlets.

3.3 Gas freeing of CA zones

3.3.1 The arrangements for gas freeing of CA zones are to be capable of purging all parts of the zone to ensure a safe atmosphere.

3.3.2 Cargo air cooling fans and the air refreshing arrangements may be used for gas freeing operations.

3.3.3 Gas freeing outlets are to be led to a safe place in the atmosphere 2 m above the deck, away from accommodation spaces and intakes of the fans for accommodation.

3.4 Ventilation of adjacent spaces

3.4.1 Deckhouses and other adjacent spaces which require to be entered regularly are to be fitted with a positive pressure type mechanical ventilation system with a capacity of at least 10 air changes per hour capable of being controlled from outside these spaces.

3.4.2 Adjacent spaces not normally entered are to be provided with a mechanical ventilation system which can be permanent or portable to gas free the space prior to entry.

3.4.3 Ventilation inlets are to be arranged so as to minimise recycling any gas and are to be at least 10 m in the horizontal direction away from the ventilation outlets.

■ **Section 4** **Gas systems**

4.1 General

4.1.1 Means are to be provided to achieve and maintain the required oxygen and/or carbon dioxide levels in the CA zones. This may be accomplished by the use of stored gas, portable or fixed gas generating equipment or other equivalent arrangements. The arrangements are to be such that a single failure will not cause a complete loss of gas supply to the CA zones.

4.1.2 The gas system is to have sufficient capacity to make good any gas loss from the CA zones and to maintain a positive pressure in all CA zones.

4.1.3 The gas system is also to be able to:

- (a) Deliver gas at 125 per cent of the specified flow rate with two compressors operating.
- (b) Maintain the specified gas levels in all CA zones when operating 24 hours per day with one unit on stand-by.

4.1.4 Air intakes are to be located to ensure that contaminated air is not drawn into the compressors.

4.1.5 Where it is intended to supply gas by means of stored gas bottles, the arrangements are to be such that depleted bottles may be readily and safely disconnected and charged bottles readily connected.

4.2 Location

4.2.1 Fixed gas generating equipment, gas bottles or portable gas generators are to be located in a compartment reserved solely for their use. Such compartments are to be separated by a gastight bulkhead and/or deck from accommodation, service and control station spaces. Access to such compartments is to be only from the open deck.

4.2.2 Gas piping systems are not to be led through accommodation, service and machinery spaces or control stations.

4.3 Gas supply

4.3.1 The gas systems are to be designed so that the pressure which they can exert on any CA zone will not exceed the design pressure of the zone.

4.3.2 During initial operation, arrangements are to be made to vent the gas outlets from each generator to the atmosphere. All vents from gas generators are to be led to a safe location on the open deck.

4.3.3 Where gas generators use positive displacement compressors, a pressure relief device is to be provided to prevent excess pressure being developed on the discharge side of the compressor.

4.3.4 Suitable arrangements are to be provided to enable the supply main to be connected to an external supply.

4.3.5 Where it is intended that gas systems are to be operated unattended, the required CA zone environment is to be automatically controlled.

4.3.6 Means of controlling inadvertent release of nitrogen into CA zones, such as locked valves, are to be provided.

4.4 Gas supply compartment ventilation and alarm

4.4.1 The gas supply compartment is to be fitted with a mechanical extraction ventilation system providing a rate of at least 20 air changes per hour based on the total empty volume of the compartment.

4.4.2 Ventilation ducts from the gas generator/supply compartment are not to be led through accommodation, service and machinery spaces or control stations.

4.4.3 The air outlet duct is to be led to a safe place on the open deck.

4.4.4 The gas supply compartment is to be provided with a low oxygen alarm system.

■ *Section 5* **Relative humidity (RH)**

5.1 Humidification

5.1.1 Where a humidification system is fitted, the following requirements are to be complied with:

- (a) The supply of fresh water for humidification is to be such as to minimise the risk of corrosion and contamination of the cargo.
- (b) To prevent damage or blockage in the humidification system caused by water freezing, the air, steam or water pipelines in the cargo chambers are to be installed to facilitate ease of drainage and are to be provided with suitable heating arrangements.

■ *Section 6* **Electrical installation**

6.1 General

6.1.1 In addition to the requirements of *Pt 6, Ch 2 Electrical Engineering*, the following requirements are to be complied with:

- (a) The electrical power for the CA plant is to be provided from a separate feeder circuit from the main switchboard.
- (b) Under sea-going conditions, the number and rating of service generators are to be sufficient to supply the cargo refrigeration machinery and CA equipment in addition to the ship's essential services, when any one generating set is out of action.

■ *Section 7* **Control instrumentation and alarms**

7.1 General

7.1.1 An alarm system for monitoring the atmosphere in CA zones is to be installed which may be integral with the machinery space alarm system as required by *Pt 6, Ch 1, 2.3 Alarm systems, general requirements*.

7.1.2 Where alarms are displayed as group alarms in the main machinery space alarm system, provision is to be made to identify individual alarms at the refrigerated cargo control station.

7.1.3 The pressure in each CA zone is to be monitored and an alarm initiated when the pressure is too high or too low.

7.1.4 Where the **RH** notation is to be assigned, humidity sensors are to be installed in each of the CA zones and are to initiate an alarm when the relative humidity (RH) falls below or exceeds the predetermined set values.

7.1.5 Gas sensors or analysers are to be provided to monitor gas content in CA zones, see *Pt 7, Ch 1, 7.3 Gas analysers and sampling* and *Pt 7, Ch 1, 7.4 Gas sensors*.

7.1.6 Gas analysers and sensors are to be calibrated automatically once in every 24 hours. An alarm is to be initiated if accuracy is outside tolerance limits.

- 7.1.7 Direct readout of the gas quality within any CA zone is to be available to the operating staff on demand.
- 7.1.8 At least one automatic recorder is to be provided for the remote monitoring and recording of O₂ and CO₂ levels in each CA zone.
- 7.1.9 Alarms are to be initiated in the event of O₂ or CO₂ levels in each CA zone falling below or exceeding the predetermined set values.

7.2 Gas systems

- 7.2.1 Where air compressors are to be used for gas production, alarms are to be initiated for the following conditions:

- High lubricating oil temperature.
- High differential pressure across the filters.
- Electric supply failure.

The compressors are to shutdown automatically in the event of:

- High discharge air temperature.
- High discharge air pressure.
- Low lubricating oil pressure.
- High pressure in CA zone.

- 7.2.2 Instrumentation is to be fitted for indicating continuously:

- (a) Gas pressure.
- (b) Gas temperature.
- (c) Gas content.
- (d) Gas flow.

7.3 Gas analysers and sampling

- 7.3.1 Where analysers are fitted, at least two analysers for oxygen and carbon dioxide having a tolerance of $\pm 0,1$ per cent by volume are to be provided to determine the content of the circulated gas within the CA zones.

- 7.3.2 Two separate sampling points are to be located in each CA zone and one sampling point in each of the adjacent spaces. The arrangements are to be such as to prevent water condensing and freezing in the sampling lines under normal operating conditions. Filters are to be provided at the inlet to sampling point lines.

- 7.3.3 Arrangements of the gas sampling points are to be such as to facilitate representative sampling of the gas in the space.

- 7.3.4 Where gas is extracted from the CA zones via a sampling tube to analysers outside the space, the sample gas is to be discharged safely to the open deck.

- 7.3.5 Provision is to be made for gas sampling by means of portable equipment as required by *Pt 7, Ch 1, 9.6 Safety, alarms and instrumentation 9.6.3*.

- 7.3.6 The sampling frequency is to be at least once per hour.

7.4 Gas sensors

- 7.4.1 Where sensors are fitted, at least two sensors for each of O₂ and CO₂, having a tolerance of $\pm 0,1$ per cent are to be installed in each CA zone to monitor gas levels.

- 7.4.2 Gas sensors may be used for indication and alarm.

■ Section 8 Safety requirements

8.1 Personnel safety

- 8.1.1 CA zones are to be clearly labelled with 'Caution' and 'Danger' signs to alert personnel.

- 8.1.2 Entry hatch and manhole covers, doors leading to the CA zones and adjacent spaces are to be fitted with acceptable security-type locks and alarms activated when covers and doors are opened. The alarms are to be placed in a manned location.
- 8.1.3 All doors and access hatches to CA zones which may be under pressure are to open outwards and are to be fitted with secondary catches to prevent injury or damage during opening.
- 8.1.4 At least two portable oxygen sensors are to be provided to sample the oxygen level in all CA zones and adjacent spaces.
- 8.1.5 A means of communication is to be provided between CA zones and an attended location on deck.
- 8.1.6 Medical first aid equipment, including at least one set of oxygen resuscitation equipment, is to be provided on board.

■ *Section 9*

Inspection and testing on completion

9.1 General

- 9.1.1 CA system trials are to be witnessed on board by the LR Surveyor, before the system is put into service and before a certificate is issued. These trials are in addition to any tests which may have been carried out at the manufacturer's works.
- 9.1.2 An Operating and Safety Manual for the guidance of the ship's staff is to be provided, covering the following topics:
- (a) Principal information on the use of CA.
 - (b) Complete description of the CA installation on board.
 - (c) Hazards of low oxygen atmospheres and consequential effects on human life.
 - (d) Countermeasures when exposed to low oxygen atmospheres.
 - (e) Instructions for operation, maintenance and calibration of all gas detectors.
 - (f) Instructions for use of portable oxygen analysers with alarm for personal protection.
 - (g) Prohibition of entry to spaces under CA.
 - (h) Loading instructions prior to injection of gas.
 - (i) Procedure for checking security of CA zones, doors and access hatches prior to injection of gas.
 - (j) Gas freeing procedure for all CA zones.
 - (k) Procedure for checking atmosphere of CA zones before entry.

9.2 Gas supply and sampling systems

- 9.2.1 The gas supply main and branches are to be pressure and leak tested. The test pressures are to be 1,5 and 1,0 times the design pressure respectively.
- 9.2.2 All gas sampling lines are to be leak tested using a vacuum or overpressure method.

9.3 Air-tightness of CA zones

- 9.3.1 Air-tightness of each CA zone is to be tested and the results entered on the certificate. The measured leakage rate of each zone is to be compared with the specified value.
- 9.3.2 Either a constant pressure method or a pressure decay method is to be used to determine the degree of air-tightness.
- 9.3.3 If the constant pressure method is used, the test is to be carried out at the design pressure of the CA zones.
- 9.3.4 If the pressure decay method is used, the time for the pressure to drop from 350 Pa to 150 Pa is to be measured and the leakage is to be calculated using the following formula:

$$A.L. = \frac{7,095 \times V}{t}$$

where

A.L. = air leakage, in m³/h

V = volume of zone, in m³

where

t = time, in seconds

7,095 = constant for 200 Pa pressure decay.

During this test, adjacent zones are to be kept at atmospheric pressure.

9.4 Gas system performance

9.4.1 Capability of the gas system to supply the gas at the specified flow rate and condition is to be verified by tests.

9.4.2 If the notation conditions cannot be verified during testing, assignment of the notation is to be deferred until log book entries confirm the achievement of the specified conditions in every CA zone during a loaded passage.

9.5 Gas freeing

9.5.1 The gas freeing arrangements are to be tested to demonstrate that they are effective.

9.6 Safety, alarms and instrumentation

9.6.1 The control, alarm and safety systems are to be tested to demonstrate overall satisfactory performance of the control engineering installation. Testing is also to take account of the electrical power supply arrangements, *see also Pt 6, Ch 1, 2.3 Alarm systems, general requirements*.

9.6.2 Locking arrangements of all CA zones and adjacent spaces where gas may accumulate, provision of warning notices at all entrances to such spaces, communication arrangements and operation of alarms, controls, etc. are to be examined.

9.6.3 The provision of portable gas detectors and personnel oxygen monitors are to be verified by the LR Surveyor. Suitable calibrated instruments for measuring the levels of O₂, CO₂ and humidity, gas pressure and gas flow to the CA zones, are to be provided for testing. Their accuracy is to be verified.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

■ Section 1 Introduction

1.1 Scope

1.1.1 This Chapter is intended for the classification of self-propelled or non-self-propelled ships with specialised structures which have plant installed on board for the processing of chemicals, liquefied gases and related products, where permitted by the Flag Administration, and which fall into one of the following environmental categories:

- (a) Ships which have plants operable while navigating at sea.
- (b) Ships which have plants operable at sea, but only while the ship is attached to an offshore mooring facility.
- (c) Ships which can navigate at sea, but whose plants are intended to be operated only while the ships are in harbour or similarly protected waters.
- (d) Specialised ships, including pontoons, barges and similar structures which are designed as sea transportation vehicles to carry non-operative process plants, but which are specially constructed to be fully supported by the sea bed when the plants are operative.

1.1.2 Each category in *Pt 7, Ch 2, 1.1 Scope 1.1.1* may include provision for the storage of the products used in the process or processes concerned.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 1

1.2 General

1.2.1 The Rules are framed on the understanding that ships will not be operated in environmental conditions more severe than those agreed for the design basis and approval, without the prior agreement of Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 Except as indicated in this Chapter, the hull, propulsion machinery, auxiliary machinery, equipment for essential services of the ship, electrical installations and control engineering systems are to comply with the relevant Sections of Parts *Pt 3 Ship Structures (General)*, *Pt 4 Ship Structures (Ship Types)*, *Pt 5 Main and Auxiliary Machinery* and *Pt 6 Control, Electrical, Refrigeration and Fire*, the *Rules for Ships for the Carriage of Liquid Chemicals in Bulk* and the *Rules for Ships for Liquefied Gases*, where applicable. Hulls made of reinforced or prestressed concrete will be specially considered.

1.2.3 The additional hull structural requirements for Category 3 ships to enable them to be satisfactorily grounded on prepared foundations will be specially considered. Full details of the intended foundations and the local conditions at the site are to be submitted for use in assessing the hull structural capability, etc.

1.2.4 Where the process plant is intended to operate in close proximity to bulk storage of feedstocks and/or products, further consideration may be necessary in addition to that contained in this Chapter, particularly with regard to the provision of effective separation, methods of storage, loading and discharging arrangements.

1.2.5 For ships of all categories in *Pt 7, Ch 2, 1.1 Scope 1.1.1* except Category 1A, provision is to be made for purging, gas freeing, inerting or otherwise rendering safe the plant and process storage facilities before the ship proceeds to sea or changes location. The provisions to be adopted, if any, when a ship of Category 1A enters harbour will be specially considered.

1.2.6 In addition to the requirements for periodical surveys, a general examination of the ship, machinery and process plant is to be carried out by LR's Surveyors before and after a ship, of any category other than 1A, changes location. Every precaution is to be taken to ensure safety during such examination.

1.2.7 Requirements additional to those of this Chapter may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the process plant is intended to operate.

1.3 Classification of ship

1.3.1 A ship built in accordance with the requirements of this Chapter, or in accordance with requirements equivalent thereto, will be assigned an appropriate class in the *Register Book*, as indicated in *Pt 7, Ch 2, 2 Class notations*, and will continue to be classed so long as it is found, upon examination at the prescribed surveys, to be maintained in a safe and efficient condition, see also *Pt 7, Ch 2, 1.4 Certification of process plant 1.4.6*.

1.3.2 For each category described in *Pt 7, Ch 2, 1.1 Scope 1.1.1*, classification covers the hull, containment systems for stored products, propulsion machinery, auxiliary machinery used for essential services, and equipment necessary to maintain a suitable environment within which the plant may safely operate.

1.3.3 In general, classification will not be extended to the process plant itself, and the classification requirements do not relate to the specialised machinery, equipment and associated piping, etc. which is solely concerned with the production operations, except where the design and/or arrangements of such equipment and piping may affect the safety of the vessel.

1.3.4 When reliquefaction plant is installed, and the plant and equipment are in accordance with the requirements of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*, consideration will be given to classing the plant in accordance with *Pt 1, Ch 2, 2.6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC))*.

1.4 Certification of process plant

1.4.1 Process plant will be required to be certified by LR, and a note to the effect that this has been carried out will be appended to the class notation in the *Register Book*.

1.4.2 The certificate will include a brief description of the process plant, indicating the chemical(s) processed and the end products.

1.4.3 The certificate of the plant will cease to be valid if a significant alteration is made to the plant or the arrangements on board without the written approval of LR. This provision does not exclude the direct replacement of any item by a substitute part which has been approved and tested by LR.

1.4.4 The process plant will be required to be surveyed by LR's Surveyors at intervals to be prescribed by the Committee, dependent on the process involved.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 2

1.4.5 The class notation for the ship will, in general, state that the process plant is not classed but certificated by LR and periodically surveyed by LR's Surveyors.

1.4.6 The maintenance of the class of the ship while the plant is in operation will be dependent upon a valid certificate and the plant being found, upon examination at the prescribed surveys, to be maintained in a safe and efficient condition.

1.4.7 The plant certificate is not to be taken as a recommendation for, or an approval of, the process or processes.

■ Section 2 Class notations

2.1 Ship notations

2.1.1 Ships of Category 1A, which have chemical process plants designed to operate while the ship is navigating at sea, will be eligible to be classed '100A1 Chemical Process Factory', *see also Pt 7, Ch 2, 1.4 Certification of process plant 1.4.5.*

2.1.2 Ships of Category 1B, which have chemical plants designed for operation at sea while the ship is specially moored, anchored or otherwise linked to the shore, sea bed or other stationary vessel or structure, will be eligible to be classed '100A1 (T) moored (oil, ammonia, etc.) processing (tanker, barge, etc.) for service at . . .', *see also Pt 7, Ch 2, 1.4 Certification of process plant 1.4.5.*

2.1.3 Ships of Category 2, which have chemical plants installed and designed for operation while the ship is in harbour, will be eligible to be classed '100A(T) chemical process plant installed – for operation only when moored in harbour', *see also Pt 7, Ch 2, 1.4 Certification of process plant 1.4.5.*

2.1.4 Specialised ships of Category 3 which have chemical plants designed to operate only while the ship is fully supported on the sea bed, will be eligible to be classed 'A chemical process plant pontoon/platform – to be operated only when grounded on prepared foundations at...', *see also Pt 7, Ch 2, 1.4 Certification of process plant 1.4.5.*

2.2 Additional notations

2.2.1 A special chemical cargoes notation may be assigned to ships where raw materials or products are stored or retained on board in bulk.

2.2.2 The Committee may append details of process, product storage, safety or other particulars to the notation as it considers necessary.

2.2.3 Ships of Category 1B or 2 which have process plants installed solely for the purposes of the physical liquefaction of impure feedstock gases at low temperatures and the storage of the purified liquefied gases (where the chemical treatment of the impurities is an incidental process) will be assigned additional notations to those stated in *Pt 7, Ch 2, 2.1 Ship notations 2.1.2* or *Pt 7, Ch 2, 2.1 Ship notations 2.1.3* such as 'for liquefaction and storage of methane, etc. in independent tanks Type B, etc. – maximum pressure – minimum temperature'.

2.3 Special mooring and linking arrangements

2.3.1 Where the process plant is operable only when the ship is specially moored, anchored or otherwise linked to the shore, sea bed or other stationary vessel, and the equipment and/or other linking arrangements and components have been approved by the Committee as suitable and sufficient for the intended service, an equipment character, T, will be assigned in addition, or as an alternative, to the equipment character 1, as appropriate.

2.3.2 For the purpose of the Rules, the word 'linked' is to be taken to include spuds, retractable legs, floating or submerged pipelines connecting directly to the ship, ship to shore electrical connections, etc. which restrain the ship in its operating position, or which require such restraint to be applied and the failure of which could hazard the ship.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Section 3

■ Section 3 Plans and particulars

3.1 General

3.1.1 Before the work is commenced, plans in triplicate, together with the relevant information as detailed in this Section, are to be submitted for consideration. Any subsequent modifications are subject to approval before being put into operation.

3.1.2 Any alterations to basic design, construction, materials, manufacturing procedure, equipment, fittings or arrangements of the process are to be re-submitted for approval.

3.1.3 For Category 1 ships, the plant is to be capable of sustaining an emergency condition at full operating temperatures and pressures with the hull statically listed to an angle of $22\frac{1}{2}^{\circ}$ and statically trimmed to an angle of 10° beyond the maximum normal operating trim. These angles may be modified by the Committee in particular cases as it considers necessary. The stress calculations for the plant and the supporting structure are to take account of this condition. Wind loads need not be considered to be acting during this emergency condition.

3.1.4 For Category 2 ships, the plant is to be capable of sustaining an emergency condition at full operating temperatures and pressures with the hull statically listed to an angle of 15° and statically trimmed to an angle of 5° beyond the maximum normal operating trim. These angles may be modified by the Committee in particular cases as it considers necessary. The stress calculations for the plant and the supporting structure are to take account of this condition. Wind loads need not be considered to be acting during this emergency condition.

3.2 Hull construction

3.2.1 For all categories of ship, the plans and information detailed in *Pt 7, Ch 2, 3.2 Hull construction 3.2.2* are to be submitted, in addition to those required by *Pt 3, Ch 1, 5 Information required, Chapter IV* of the Rules for Ships for Liquid Chemicals or *Ch 4 Cargo Containment* of the Rules for Ships for Liquefied Gases, as applicable.

3.2.2 Plans showing the general arrangement of the ship are to be submitted, giving the location of the following:

- Hatches and other openings to enclosed plant spaces and adjacent cofferdams.
- Doors, hatches, ventilation and other openings to crew accommodation, stations essential for operation at sea, control stations, store rooms and workshops.
- Coated tanks or tanks constructed of special material.
- Additional structure associated with the plant above the deck.
- Proposed grouping of areas within the plant for segregation purposes.

3.2.3 Plans for mooring, anchoring and linking, as applicable, together with relevant wind and sea data are to be submitted for information.

3.2.4 Plans outlining the containment arrangements in the event of an accident, together with all relevant information, are to be submitted.

3.2.5 Particulars of the marine environment and safety arrangements associated with the process plant are to be submitted, including:

- Arrangements for preventing the ingress of water into the ship or structure where process plant and equipment protrude through the weather deck.
- Proposed emergency flooding procedures and their control.

3.2.6 Particulars of the proposed storage arrangements of hazardous and/or toxic substances, feedstocks and products in bulk, on the ship or structure, are to be submitted.

3.3 Process plant

3.3.1 A description of the expected method of operation of the process plant and a diagram showing the process flow are to be submitted.

3.3.2 General arrangement plans of the process plant showing the hazardous and safe zones and spaces are to be submitted, indicating the following:

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 3

- Spaces where toxic gases or vapours may accumulate.
- Spaces where flammable gases or vapours may accumulate.
- Areas maintained at an over-pressure to prevent the ingress of such gases or vapours.

3.3.3 Details of the flammability, toxicity, corrosivity and reactivity of the substances entering, being processed and leaving, or stored in, each compartment, together with details of any exothermic and hazardous reactions particularly with regard to sea-water and other materials normally found in the marine environment, are to be submitted.

3.3.4 Plans of the layout of the process plant indicating the hatches and other openings to enclosed plant spaces and cofferdams are to be submitted.

3.3.5 Details and arrangements of the blow-down systems, including quantities of materials and the capacity and working pressure of the containers installed for the reception of the materials to be blown down, are to be submitted.

3.3.6 Proposals for de-watering blow-down tanks in which hot oils and/or chemicals are discharged are to be submitted.

3.3.7 Proposals for the purging, gas freeing, inerting or otherwise rendering safe of the process plant and storage facilities are to be submitted.

3.3.8 Particulars of the arrangements for protecting the process plant systems and vessels against temperature, over-pressure and vacuum are to be submitted.

3.3.9 Proposals for the disposal of hazardous or toxic gases and liquid effluents during normal plant operation, including any proposed flare systems, are to be submitted.

3.3.10 Particulars of the proposals for isolating the ship or structure from the shore installation and/or lightering ships or vessels, where applicable, and from the supply of fuel to boilers, etc. in the process plant and the return flow of chemicals or process effluent, are to be submitted, including:

- Feedstock supply and product discharge, with details of the arrangements showing the location of shut-off valves and of the control and indicating stations.
- The process plant parameters and analysis of transient conditions under which emergency shutdown will be initiated and the time estimated to obtain a safe environment.
- The proposed emergency procedures for controlled shutdown of the process plant, i.e. depressurising, inerting, etc. and the arrangements for the continued operation of the essential services necessary to allow for such controlled shutdown under the emergency conditions of *Pt 7, Ch 2, 3.1 General 3.1.3* or *Pt 7, Ch 2, 3.1 General 3.1.4*, as applicable.

3.3.11 Plans for the ventilation of process plant compartments are to be submitted, together with the following information:

- Location of hazardous and safe zones and spaces.
- Location of all possible sources of ignition.
- Location of air inlets and outlets.
- Number of complete air changes per hour.
- Estimated maximum and minimum ambient temperatures for the regions in which the plant is to operate.
- Expected heat loss of the process plant to the compartment environment.

3.3.12 Particulars of any dust or gas explosion hazard in the enclosed compartments of the process plant are to be submitted.

3.3.13 Proposals for the decontamination of the process plant compartments are to be submitted.

3.3.14 Proposals for the detection of vapour or gas and of oxygen deficiency in the process plant compartments are to be submitted.

3.4 Mechanical equipment associated with the process plant

3.4.1 A list of mechanical equipment associated with the process plant, with the exception of any boilers and other pressure vessels, to be installed in the ship or structure is to be submitted.

3.4.2 Details of safety and relief devices and their discharge arrangements are to be submitted.

3.4.3 When required, in order to facilitate inspection, plans showing the materials of construction, working pressures and temperatures, maximum power and revolutions per minute, as applicable, are to be submitted before the work is commenced.

3.4.4 Calculations of the torsional vibration characteristics of the shafting systems, where applicable, are to be submitted in accordance with the requirements of *Pt 5, Ch 8 Shaft Vibration and Alignment*.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 3

3.5 Boilers and other pressure vessels associated with the process plant

3.5.1 Plans of the boilers and other pressure vessels, including the proposals for the support of the vessels, are to be submitted.

3.5.2 Details of the safety and relief devices and their discharge arrangements are to be submitted.

3.5.3 Stress calculations are to be submitted, taking into account the ship linear and angular accelerations, roll and pitch amplitudes, ship flexure and wind loads appropriate to any condition which may normally arise at sea. Where applicable, calculations for the emergency condition in *Pt 7, Ch 2, 3.1 General 3.1.3* or *Pt 7, Ch 2, 3.1 General 3.1.4* are to be submitted. Due consideration is to be given to the effects of thermal expansion and contraction on the support points of the vessels.

3.5.4 Outline plans of all types of fired equipment, ventilation arrangements with projected casing temperatures, uptake arrangements, gas and/or fuel oil burning arrangements and controls are to be submitted.

3.6 Pumping and piping systems associated with the process plant

3.6.1 Plans of the process plant piping systems, showing the materials of construction, scantlings, support and expansion arrangements, together with the calculations, are to be submitted for consideration.

3.6.2 The following diagrammatic plans for systems associated with the process plant are to be submitted, in addition to those required by *Pt 5, Ch 13 Ship Piping Systems* and *Pt 5, Ch 15 Piping Systems for Oil Tankers* or Chapter V of the Rules for Ships for Liquefied Gases, as applicable:

- The Shipbuilder's plan of the general pumping arrangements, including air and sounding pipes and any cross flooding pipes and fittings.
- Pumping arrangements at the fore and aft ends, drainage of cofferdams and process spaces.
- Bilge, ballast and fuel oil pumping arrangements in the process plant machinery space, including the capacities of the pumps on bilge service.
- Arrangement of fuel oil pipes and fittings at settling and service tanks.
- Arrangement of gas and/or fuel oil piping in connection with gas and/or oil burning arrangements.
- Fuel oil overflow systems, where fitted.
- Arrangement of boiler feed system.
- Arrangement of compressed air systems for the process plant.
- Arrangements of lubricating oil and cooling water systems, fuel oil settling, service and other oil tanks not forming part of the ship's structure.

3.6.3 Plans showing the arrangement and dimensions of main steam pipes, with details of flanges, bolts and weld attachments and particulars of the materials of the pipes, flanges, bolts and welding consumables, are to be submitted for consideration.

3.6.4 Details of the safety and relief devices and their discharge arrangements are to be submitted.

3.7 Electrical equipment for the process plant

3.7.1 Details of the electrical system(s) are to be submitted, including the following:

- A statement quoting the standard or Code of Practice in accordance with which the installation has been designed.
- A statement quoting the standard of design and/or manufacture of electrical equipment, e.g. BS, NEMA, VDE, etc.
- A schedule of the normal operational loads on the system, estimated for the different operating conditions expected.
- Expected range of ambient temperature.

3.7.2 The following line diagram plans and particulars are to be submitted:

- General arrangement plan of the process plant showing the location of the major items of electrical equipment.
- Line diagram of the installation(s) indicating the rating of the various items of rotating machinery, converters, transformers and protective devices, together with the types and sizes of cables and the makes and types of protective devices.
- Arrangement plans and circuit diagrams of the switchboards.
- Calculations of short-circuit currents at the main switchboards, sub-switchboards and the secondary side of transformers.
- General arrangement plan of the process plant showing the location of electrical equipment in hazardous zones, together with the Code of Practice on which they are based.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 4

- A schedule of safe-type electrical equipment located in hazardous zones, giving details of the type of equipment employed, the certifying authority and the certificate number.

3.7.3 Written confirmation and Works' Test Certificates that all items of electrical equipment comply with the relevant standard or Code of Practice are to be supplied.

3.8 Control equipment for the process plant

3.8.1 Details of the control system(s) are to be submitted, together with the following line diagrams and particulars:

- Line diagrams of any control system(s) fitted.
- General arrangement plan of the process plant showing the locations of items of control equipment and the locations of hazardous zones.
- Schedule of the parameters which are monitored and controlled, including alarms and shutdown devices.

3.9 Fire protection, detection and extinction

3.9.1 Plans of fire protection, detection and extinction arrangements, together with details of the fire and explosion hazards involved, are to be submitted.

■ Section 4 Materials

4.1 General

4.1.1 The materials used in the construction are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021* (hereinafter referred to as the Rules for Materials) and of *Chapter 6* of the Rules for Ships for Liquefied Gases, as applicable. Materials for which provision is not made in those requirements may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

4.1.2 Materials of construction are to be suitable for the intended service, having regard to the substances, process and temperatures involved. For materials unsuitable for use with certain chemicals, and for the protection of materials, see *Chapter 6* of the Rules for Ships for Liquid Chemicals.

4.1.3 Details of the materials proposed for all types of construction are to be submitted for approval.

■ Section 5 Process plant characteristics

5.1 Design

5.1.1 The design and arrangements are to comply with the requirements of this Chapter and with relevant statutory regulations of the National Authority of the country in which the ship or structure is registered and/or in which it is to operate.

5.1.2 The process plant is to be designed for normal operation in accordance with recognised and agreed codes suitably modified to take into account the ship-borne environment in all its aspects. Except for emergency conditions, as detailed in *Pt 7, Ch 2, 3.1 General 3.1.3* or *Pt 7, Ch 2, 3.1 General 3.1.4*, the total stress in any component of the plant is not to exceed the code value at the temperature concerned, unless expressly agreed otherwise by LR, whether the plant is operative or non-operative, when subjected to any possible combination of the following loads:

- Static and dynamic loads due to wave-induced ship motions.
- Loads resulting from hull flexural effects at the plant support points.
- Direct wind loads.
- Normal process weights and pressures.
- Thermal loads.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 6

5.1.3 For the emergency conditions in *Pt 7, Ch 2, 3.1 General 3.1.3* or *Pt 7, Ch 2, 3.1 General 3.1.4*, the stress levels are to be agreed with LR.

5.2 Separation from ship machinery

5.2.1 Where, during operation, process plant spaces contain or are likely to contain hazardous and/or toxic substances, they are to be kept separate and distinct from the main propulsion and auxiliary machinery and essential ship services, and also the power generating machinery for the process plant.

5.2.2 Notwithstanding the requirements of *Pt 7, Ch 2, 5.2 Separation from ship machinery 5.2.1*, this does not exclude the use of the ship's main, auxiliary and/or essential services, for process plant operation in suitable cases. Where, for reason of hazard, essential ship services have to be duplicated within the process plant space, they are to comply with the requirements of *Pt 7, Ch 2, 9 Pumping and piping systems for the process plant* and *Pt 5 Main and Auxiliary Machinery* and *Pt 6 Control, Electrical, Refrigeration and Fire*, as applicable.

Section 6 Hull construction

6.1 General

6.1.1 The hull structure is to comply with the relevant requirements of *Pt 3 Ship Structures (General)* and *Pt 4 Ship Structures (Ship Types)*, except as stated otherwise in this Section. The containment of liquefied gas products is to comply with *Ch 4 Cargo Containment* of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*.

6.1.2 All chemical product and effluent tank structures and their location relative to the ship's hull are to comply with the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*, or with the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk, July 2021*, as applicable. Where necessary, the probable temperature variations during operations and the thermal stress considerations are to be stated.

6.1.3 Materials for the hull structures subjected to low temperature are to comply with *Pt 3, Ch 2, 2.2 Refrigerated spaces* relating to refrigerated spaces and adjacent structures, or with *Chapter 6* of the *Rules for Ships for Liquefied Gases*, as applicable.

6.1.4 Subdivision and damage stability are not covered by these Rules. However, attention must be given to any relevant statutory regulations of the National Authority of the country in which the ship is to be registered or in which the plant is to be operated.

6.2 Location of accommodation, service and control spaces

6.2.1 All accommodation and other compartments not directly essential to the operation of the plant are to be arranged well clear of plant spaces, and feedstock and product tanks.

6.2.2 Service and control stations essential to the operation of the plant must be made 'gas-safe' in accordance with internationally accepted codes and standards, and should, wherever possible, be so located that access thereto is from a defined safe space. If such location is not possible, the station is to be specially ventilated.

6.3 Integrity of gastightness between compartments

6.3.1 Where integrity of gastightness is required between compartments containing the plant, this is to be maintained in way of pipe tunnels or duct keels where these traverse such compartments.

6.4 Cofferdams

6.4.1 Cofferdams are to be sited as required by the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*, or by the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk, July 2021*, as applicable, segregating any spaces in which raw materials or products are stored or retained in bulk.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 6

6.4.2 Cofferdams are to be arranged around independent tanks containing chemical products or effluents where these are separate from the ship structure, but permanently connected thereto. Such cofferdams are to be mechanically ventilated using portable or permanent systems as required by *Chapter 12* of the Rules for Ships for Liquid Chemicals, and are to be of sufficient size to allow effective inspection of all the tank and ship structure in way.

6.5 Access and openings to spaces

6.5.1 Access openings, windows, side scuttles and ventilation openings to accommodation, service and control stations essential for the operation of the ship, and similar safe spaces are to be located and arranged as required by the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*, or by the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk, July 2021*, as applicable.

6.5.2 Arrangements are to be made to provide easy access to, or escape from, plant working spaces. In general, ladders are not to be arranged vertically, and intermediate platforms are to be fitted at vertical intervals of about 6 m. Ladders and platforms are to have guard rails and permanent provision made for attaching hoists for use in emergencies. The arrangements for the emergency hoists are to allow a clear, unobstructed lift to the outside deck.

6.5.3 Two separate means of access from the open deck are generally to be provided to the cofferdams required by *Pt 7, Ch 2, 6.4 Cofferdams 6.4.1*.

6.6 Longitudinal strength

6.6.1 Longitudinal strength calculations are to be made in accordance with *Pt 3, Ch 4 Longitudinal Strength* for the following conditions, and the Loading Manual required by *Pt 3, Ch 4, 8 Loading guidance information* is to include this information:

(a) Sea-going conditions:

These conditions are to take account of the weights and disposition of all ballast, plant items including any working fluids, other substances, spare gear, etc. and any special support bracing where thermal effects are considered, which will be on board during any sea-going condition of the plant appropriate to the category of ship.

(b) Harbour condition:

This condition is to take account of the weights and disposition of all ballast and plant items, including all working and other substances (in all intended stowage dispositions) and spare gear which will be on board during operation of the plant in harbour.

6.7 Plant support structure

6.7.1 Decks and other structure supporting the plant are, in general, to comply with the requirements of *Pt 3 Ship Structures (General)*. Such structure can, however, be considered on the basis of an agreed uniformly distributed loading in association with local loads at plant support points, provided that adequate transverse strength of the ship is maintained.

6.7.2 Where the nature and dispositions of heavy plant items are such that forces on the ship and support structure due to ship motions are significant (whether underway with or without working fluids, or moored with working fluids), calculations of the loading and the structural response are to be submitted. In this respect, the guidance formulæ for accelerations as given in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021* can be used where appropriate. Details of the mass distribution and support points of the plant items are to be submitted in all cases.

6.7.3 Where model tests or reliable direct calculation procedures are used to estimate wave-induced responses and which may indicate accelerations and motion amplitudes differing from those arising from the application of the Rules, such values will be taken into account in the approval of support structure.

6.7.4 If the vessel is intended for limited service at sea (e.g. a 'once only' voyage from port of build to service location), a reduction in the Rule accelerations and motion amplitudes may be permitted. In order to apply such a reduction, details of the intended service limitation should be submitted.

6.8 Loading due to wave-induced motions

6.8.1 In cases where the mass distribution of large columnar plant items is such that the centre of action of the dynamic force differs significantly from the centre of gravity of the item, due account of this is to be taken in the calculation of the forces and moments at the support positions.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 6

6.9 Additional loads

6.9.1 The structure supporting the plant is also to be capable of withstanding forces arising from the following:

- (a) Wind loads (in all conditions of service and all categories of ships).
- (b) The angle of static heel arising from the emergency condition referred to in *Pt 7, Ch 2, 3.1 General 3.1.3* or *Pt 7, Ch 2, 3.1 General 3.1.4*, as applicable.
- (c) For a Category 1 A ship, a collision force acting on the tank corresponding to one-half of the weight of the item with or without working fluids, as appropriate, to the approved sea-going conditions from forward and one-quarter of the weight of the item from aft.
- (d) For all other categories of ship, a collision force from any horizontal direction of one-fifth of the weight of the item.

6.9.2 Wind loading, which is to be applied to the plant items and supporting structure protruding above the weather deck, should be considered to act simultaneously with wave-induced loading. Loadings *Pt 7, Ch 2, 6.9 Additional loads 6.9.1.(b)*, *Pt 7, Ch 2, 6.9 Additional loads 6.9.1.(c)* and *Pt 7, Ch 2, 6.9 Additional loads 6.9.1.(d)* need not be combined with wind loads or wave-induced loads.

6.10 Allowable stresses in support structure

6.10.1 The following stress levels are applicable in conjunction with the loading on the support structure:

- (a) Support members above or below the weather deck which are not subject to main hull girder loading:

direct stress:

$$\sigma_a + \sigma_b = 0,6\sigma_y$$

shear stress:

$$\tau = 0,6\tau_y \text{ or } 0,35\sigma_y \text{ whichever is the smaller}$$

combined stress:

$$\sigma_c = 0,75 \sigma_y = \sqrt{(\sigma_a + \sigma_b)^2 + 3 \tau^2}$$

where

$\sigma_a + \sigma_b$ = the algebraic sum of the axial and bending stresses at the point under consideration

σ_y = specified minimum tensile yield stress or 0,2 per cent proof stress at room temperature

τ_y = shear yield stress.

- (b) Support members directly connected to hull structure and subject to transference of loading therefrom:
 - the maximum allowable direct, shear and combined stresses as defined in (a), but with member local loading increased by a factor of 1,30, or
 - when the stresses in such structure are determined using methods which satisfactorily take into account any ship deflection and load transference in way of supports, no load factor need be applied.
- (c) Primary members forming an integral ship structural and plant support system:
 - in general, the allowable stresses in such a system will be especially considered on the basis of the degree of refinement employed in the load prediction, structural response and stress analysis methods. Structural response calculations should include the interaction effects of the hull and plant item.

6.10.2 In general, all seatings, platform decks, girders and pillars supporting plant items are to be arranged to align with the main hull structure, which is to be suitably reinforced, where necessary, to carry the appropriate loads. Attention should be paid to the capability of the support structure to withstand buckling.

6.11 Integrity of weather deck

6.11.1 The integrity of the weather deck is to be maintained. Where items of plant equipment penetrate the weather deck and are intended to constitute the structural barrier to prevent the ingress of water to spaces below the freeboard deck, their structural strength is to be equivalent to the Rule requirements for this purpose. Otherwise such items are to be enclosed in superstructures or deckhouses fully complying with the Rules. Full details are to be submitted for approval.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 7

6.12 Equipment

6.12.1 Anchors and chain cables for ships navigating at sea are to comply with the requirements of *Pt 3, Ch 13, 7 Equipment*. Special consideration will be given to the equipment required for ships of Categories 1B and 2.

6.13 Gangways and freeing arrangements

6.13.1 Gangways are to be sufficient to provide proper access to all areas necessary for ship safety while the ship is operational and while it is at sea, and are to be to the Surveyor's satisfaction.

6.13.2 Freeing ports are to be fitted in accordance with the requirements of *Pt 3, Ch 8, 5.3 Freeing arrangements*.

■ Section 7 Mechanical equipment for the process plant

7.1 General

7.1.1 The requirements of this Section are applicable to all types of mechanical equipment associated with the process plant, with the exception of boilers and other pressure vessels.

7.1.2 The mechanical plant and equipment is to be designed and constructed in accordance with the relevant Sections of *Pt 5 Main and Auxiliary Machinery* and *Pt 6, Ch 3 Refrigerated Cargo Installations*, as applicable, and/or with agreed codes and specifications, suitably modified where necessary to suit shipboard conditions. The design is to be capable of accommodating the forces and moments stated in *Pt 7, Ch 2, 6.7 Plant support structure*, *Pt 7, Ch 2, 6.8 Loading due to wave-induced motions* and *Pt 7, Ch 2, 6.9 Additional loads*, as applicable, generated at the support points.

7.2 Safety precautions

7.2.1 Engines, air compressors and associated air starting piping, concerned with supplying services not essential to the safety of the vessel or structure, are to comply with the requirements of *Pt 5, Ch 2 Reciprocating Internal Combustion Engines*, where applicable.

7.2.2 Air intakes for internal combustion engines are to be led from a safe space. Where internal combustion engines, other than gas turbines, are used in association with plant processing flammable substances, the air intakes are to be fitted with an automatic device to prevent overspeeding in the event of accidental ingestion of flammable gases and/or vapours.

7.2.3 Exhaust pipes from internal combustion engines are to be led well clear of hazardous areas and, where such engines are used in association with plant processing flammable substances, are to be fitted with efficient spark arresters.

7.2.4 In general, air compressors are not to be installed in hazardous areas. Where this is not practicable, alternative arrangements may be accepted, provided that the air inlets are trunked or ducted from a safe space and that such trunking/ducting is fitted with gas detectors arranged to give audible and visible alarms and to shutdown the compressor in the event of flammable and/or toxic gas or vapour entering the air inlets.

7.2.5 The gas detectors are to be capable of continuously sampling the air supply and are to be so arranged as to prevent cross-communication between hazardous and safe spaces, such as control rooms, etc.

7.3 Inspection and installation

7.3.1 The scope of the inspection to be carried out at the manufacturers' works by the Surveyors is to be agreed before the work is commenced.

7.3.2 The mechanical plant and equipment are to be installed to the Surveyor's satisfaction. Proposals to site internal combustion engines in hazardous areas will be the subject of special consideration.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 8

■ Section 8

Boilers and other pressure vessels for the process plant

8.1 General

8.1.1 The requirements of this Section are applicable to fired and unfired pressure vessels associated with the process plant.

8.1.2 The pressure vessels are to be made in accordance with the requirements of the relevant Sections of *Pt 5, Ch 10 Steam Raising Plant and Associated Pressure Vessels* or *Pt 7, Ch 2, 11 Electrical equipment for the process plant*, as applicable, or with agreed codes and specifications normally used for similar plant in land installations suitably modified and/or adapted for the marine environment. The design is to be capable of accommodating the forces and moments stated in *Pt 7, Ch 2, 6.7 Plant support structure*, *Pt 7, Ch 2, 6.8 Loading due to wave-induced motions* and *Pt 7, Ch 2, 6.9 Additional loads*, as applicable, generated at the support points.

8.1.3 Stress calculations are to take account of the emergency conditions in *Pt 7, Ch 2, 3.1 General 3.1.3* or *Pt 7, Ch 2, 3.1 General 3.1.4*, as applicable, in addition to the normal operational loadings. Due consideration is to be given to the effects of thermal expansion and contraction on the support points of the vessels.

8.2 Construction and installation

8.2.1 The pressure vessels are to be constructed, installed and tested to the Surveyor's satisfaction.

8.2.2 Suitable access is to be provided to the vessels for inspection, including checks on the operation of mountings, fittings, controls and pressure relief devices.

8.3 Safety devices

8.3.1 Where necessary, a test rig is to be supplied to enable the pressure setting of the safety and relief devices to be checked.

8.3.2 Where required, an additional pressure relieving device, with sufficient capacity (a) to prevent pressure vessels becoming liquid-full during fire engulfment and/or (b) to discharge vapours generated under fire exposure, is to be fitted in accordance with the relevant *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*.

8.3.3 The arrangement of safety and relief discharges is to be such that there is no possibility of hazardous reaction between the substances involved.

8.3.4 Where provision is made for the isolation of safety relief devices from vessels and/or systems for maintenance purposes, not less than two such safety devices are to be fitted.

8.3.5 The isolating or blocking valves are to be so arranged that at least one safety relief device will remain in communication with the vessel or system under all conditions.

■ Section 9

Pumping and piping systems for the process plant

9.1 General

9.1.1 Arrangements are to be made in the process plant spaces, in order that substances which are flammable, toxic or are likely to present a hazard due to reaction when mixed are kept separate.

9.2 Process plant piping systems

9.2.1 Process plant piping systems are to be designed and constructed in accordance with agreed codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted where necessary to suit the marine environment.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 10

9.2.2 Sections of piping which may contain hazardous liquids or gases and which can be isolated are to be suitably protected, see *Pt 7, Ch 2, 8.3 Safety devices 8.3.2*.

9.3 Lubricating oil and fuel oil piping

9.3.1 Lubricating oil and fuel oil pipes, fittings, associated equipment, fuel oil burning arrangements and their materials of construction are to comply with the requirements of *Pt 5, Ch 14 Machinery Piping Systems*, where applicable.

9.4 Gas fuel supply systems

9.4.1 The gas fuel supply systems are to comply with the requirements of the relevant Sections of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*, where applicable.

9.4.2 Provision to shut off the gas is to be made in the gas firing supply lines immediately before the lines enter the compartment in which the equipment is installed. The shut-off arrangements are to be of the double block and vent type, and are to be operable at the equipment or the equipment control position and at a position in a safe area remote from the equipment.

9.5 Air and sounding pipes

9.5.1 Details of air and sounding pipes to tanks containing chemical products are to be submitted for approval.

9.6 Bilge and effluent arrangements

9.6.1 The arrangements for the storage on board ship, and the disposal of bilge and effluent from the process plant spaces, are to be submitted for consideration, and due recognition is to be given to the requirements of the appropriate National Authority.

9.6.2 Bilge and effluent pumping and piping systems in the process plant spaces are to be constructed of material suitable for the substances processed or produced or any combination of the substances which might result from accidental admixture.

9.6.3 Arrangements are to be provided for the control of the bilge and effluent pumping and piping system installed in the process plant spaces from within these spaces and also from a position outside the spaces.

9.6.4 The bilge and effluent pumping and piping systems handling hazardous materials should, wherever possible, be installed in the space associated with the particular hazard. Spaces containing pumps and piping systems that take their suction from a hazardous space may also be considered as hazardous spaces where a pipeline is not of an all-welded construction without flanges, valve glands and bolted connections, etc. and the pumps are not totally enclosed.

9.6.5 Where, during operation, process plant spaces contain or are likely to contain hazardous and/or toxic substances, they are to be kept separate and distinct from the ship's main bilge pumping and piping system. This does not, however, preclude the use of the ship's main bilge system when the process plant is shutdown, gas freed or otherwise made safe.

9.6.6 Pumping and piping systems for the ship services and process plant are to be constructed and installed to the Surveyor's satisfaction.

■ Section 10

Firing arrangements of steam boilers, fired pressure vessels, heaters, reformers, etc.

10.1 General

10.1.1 The requirements of this Section are applicable to all types of fired equipment associated with the process plant. The equipment is to be constructed, installed and tested to the Surveyor's satisfaction.

10.2 Design and construction

10.2.1 Details of the design and construction of the fuel gas burning equipment for steam boilers, oil and gas heater furnaces, reformers, etc. are to be in accordance with the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021*, or with agreed codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted for the marine environment. Ignition of the burners is to be by means of permanently installed igniters, or properly located and interlocked pilot burners and main burners arranged for sequential ignition.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 11

10.2.2 Gas or gas/air mixtures having relative densities compared with that of air at the same temperature greater than one are not to be used as fuels for fired pressure vessels situated below deck. Proposals to burn such mixtures above deck will be specially considered in each case.

10.2.3 Proposals for the furnace purging arrangements prior to ignition of the burners are to be submitted. Such arrangements are to ensure that any accidental leakage of product liquid or gas into the furnace, from a liquid or gas heating element, or from the accidental ingestion of flammable gases and/or vapours, does not result in hazardous conditions.

10.2.4 Compartments containing fired pressure vessels, heaters, reformers, etc. for heating or processing hazardous substances are to be so arranged that the compartment in which the fired equipment is installed is maintained at a higher pressure than the combustion chamber of the equipment. For this purpose, induced draught fans or a closed stokehold system of forced draught may be employed. Alternatively, the fired equipment may be enclosed in a pressurised air casing.

10.2.5 The fired equipment is to be suitably lagged. The clearance spaces between the fired equipment and any tanks containing oil are to be not less than 760 mm. The compartments in which the fired equipment is installed are to be provided with an efficient ventilating system.

10.2.6 Smoke box and header box doors of fired equipment are to be well-fitting and shielded, and the uptake joints made gastight. Where it is proposed to install dampers in the uptake gas passages of fired equipment, the details are to be submitted. Dampers are to be provided with a suitable device whereby they may be securely locked in the fully open position.

10.2.7 Each item of fired equipment is to have a separate uptake to the top of the stack casing. Where it is proposed to install process fired equipment with separately fixed furnaces converging into a convection section common to two or more furnaces and/or a secondary radiant section at the confluence of the fired furnace uptake to the convection section, the proposed arrangements, together with the details of the furnace purging and combustion controls, are to be submitted.

■ Section 11 Electrical equipment for the process plant

11.1 Design of installation

11.1.1 Installations are to be designed in accordance with *Pt 6, Ch 2 Electrical Engineering*, or with a recognised National or International Standard or Code of Practice.

11.1.2 Attention must be given to any relevant statutory regulations of the National Authority of the country in which the ship is to be registered or in which the process plant is to be operated.

11.2 Equipment suitability for environment

11.2.1 Electrical equipment is to be constructed so that it is suitable for use in the environmental conditions envisaged, e.g. in areas of high ambient temperature, derating may be necessary.

11.3 Hazardous zones

11.3.1 Where flammable gases and vapours are involved, the defining of hazardous zones is to be in accordance with a National or International Standard or Code of Practice.

11.4 Certified safe-type equipment

11.4.1 Where safe-type equipment is permitted in hazardous zones, e.g.:

- Intrinsically-safe (symbol i),
- Flameproof (symbol d),
- Increased safety (symbol e),
- Pressurised enclosure (symbol p),

such equipment is to be certified for the gases and vapours involved. The construction and type testing are to be in accordance with IEC 60079: *Electrical Apparatus for Explosive Gas Atmospheres*, or an equivalent National Standard.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 12

11.5 Survey and testing

11.5.1 All electrical equipment is to be installed and tested to the Surveyor's satisfaction.

■ Section 12

Control engineering for the process plant

12.1 Design of installation

12.1.1 Normal good engineering practice and standards are to be employed in any control system(s) fitted.

12.1.2 Due to the wide variety of types of process plant, it is not possible to lay down precise details of control scheme(s), since any control scheme is affected by the nature of, and the operating procedures of, the process plant. A description of the expected method of operation of the process plant is to be submitted.

12.2 Equipment

12.2.1 Control equipment is to be compatible with the materials involved in the plant process.

12.2.2 Where flammable gases or vapours are involved, control equipment located in hazardous zones is to be of certified safe-type.

12.3 Survey and testing

12.3.1 Control system(s) are to be installed and tested to the Surveyor's satisfaction.

■ Section 13

Plant blowdown systems

13.1 General

13.1.1 Where a liquid blowdown system is provided in the process plant, the design and installation are to make adequate provision for the effects of back pressure in the system and vapour flash off when the pressures of liquids in the blowdown system are reduced.

13.1.2 Substances which will react with each other are to be provided with separate systems.

■ Section 14

Plant flare gas systems

14.1 General

14.1.1 Details of any flare gas stack system and proposals for installation on board the ships, including safety arrangements, are to be submitted for consideration.

14.1.2 The protection zone around the nozzle of the flare gas stack is dependent upon the limiting radiation intensity under all conditions and, also, whether suitable radiation screens are provided. The flare gas stack is to be located so that the nozzle is situated not less than the radius of the protection zone or 50 m, whichever is the greater, from equipment and manned stations, etc.

14.1.3 The arrangements are to ensure that combustion of the flare gas is complete and safe at all times.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 15

■ Section 15

Supply and discharge arrangements for feedstock and product

15.1 General

15.1.1 Arrangements are to be made to isolate the ship from the supply of feedstock for processing, the supply of fuel oil or gas to boilers, heaters, etc. and the return flow of product, chemicals or process effluent, blow-down or flare gas, etc.

15.1.2 The arrangements are to provide for valves installed at the shore connection, where applicable, and on board ship which are to be operable from shut-off control and indicating stations on the ship, on the shore, and at the valves.

15.2 Emergency procedures

15.2.1 Detailed instructions of the emergency shutdown and evacuation procedure are to be posted in a prominent position at the ship and shore control stations, where applicable.

■ Section 16

Ventilation of the process plant and other spaces associated with the process plant operation

16.1 General

16.1.1 An efficient means of ventilation is to be provided for all enclosed compartments associated with the operation of the process plant.

16.1.2 The capacity of the ventilation systems is to comply with the requirements of *Pt 5, Ch 15, 1.7 Arrangements for fixed hydrocarbon gas detection systems in double hull and double bottom spaces of oil tankers* of the Rules for Ships for Liquefied Gases, or *Chapter 12* of the Rules for Ships for Liquid Chemicals, where applicable, or to an acceptable Code of Practice suitably modified and/or adapted where necessary to suit the marine environment. It is to be related to the hazard and/or environmental consideration of manned spaces during normal operation, and take into account additional requirements which may be necessary during start-up procedures.

16.2 Design and construction

16.2.1 Hazardous compartments where flammable and/or toxic substances are being processed or produced are to be arranged for underpressure ventilation, except as stated in *Pt 7, Ch 2, 10.2 Design and construction 10.2.4*.

16.2.2 Safe compartments, including control rooms, are to be arranged for overpressure ventilation.

16.2.3 The number and capacity of fans are to be such that the minimum ventilation capacity required in each compartment is maintained at all times, with one unit out of service. If internal combustion engines are proposed, their fuel supply is to be kept separate from any other system. Electric motors are to be supplied by two alternative circuits, each of which is capable of supplying all the motors which are normally connected to that circuit and which are operated simultaneously.

16.2.4 The mechanical ventilation system is to be capable of being controlled from a position outside the compartment being ventilated.

16.2.5 Reduction of ventilation capacity below the required level should be indicated in the compartment and also in the control room by an audible and visible alarm.

16.2.6 The parts of the rotating body and of the casing of each fan situated in a hazardous space are to be made of recognised spark-proof materials. If non-metallic materials are used, they are to have anti-static properties.

16.2.7 Ventilation trunking or ducting is to be suitably coated or painted, or made from material suitable for the substances processed or produced, or any combination of the substances which might result from accidental admixture.

16.3 Air inlets and discharges

16.3.1 The air inlets for the ventilation systems are to be located in a designated safe area.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 17

16.3.2 The air inlets and discharges of the ventilation system are to be so situated that recirculation of the vented vapours does not occur.

16.3.3 The discharges from ventilation systems which may contain vapours that present a hazard due to reaction with each other are to be effectively segregated.

16.3.4 The discharges from ventilation systems which may contain hazardous vapours are to be located not less than 10 m from the nearest air intake or opening to accommodation, service and control station spaces or other safe spaces, and from all possible sources of ignition.

16.3.5 Air intakes and openings into the accommodation spaces and all service and control station spaces are to be fitted with closing devices. For toxic gases, these devices are to be operable from inside the space.

16.3.6 Where it is impracticable to locate a plant service or control station so that any access thereto is from a safe space, the service or control station is to be maintained at an overpressure of not less than 5 mm water gauge above the surrounding spaces. Details of the arrangements to ensure that this pressure differential is maintained are to be submitted.

16.3.7 Airlocks for intercompartmental access doors and emergency escape trunks are to have separate ventilation systems so arranged that an overpressure of 5 mm water gauge is maintained above the adjacent compartments. Details of the arrangements to ensure that this pressure differential is maintained are to be submitted.

16.4 Installation and inspection

16.4.1 The ventilation systems are to be installed to the Surveyor's satisfaction.

16.4.2 The Surveyors are to be satisfied that the ventilation system is capable of maintaining a safe environment during process plant operation. This may require monitoring over an extended period to prove its effectiveness.

■ Section 17 Gas detection

17.1 General

17.1.1 An efficient gas detection system, suitable for the gases and/or vapours being processed or produced, and for the measurement of oxygen levels in the process plant compartments, is to be provided. Gas detector systems are also to comply with the requirements of *Pt 7, Ch 2, 17 Gas detection* or of *Ch 13 Instrumentation and Automation Systems* of the Rules for Ships for Liquefied Gases, where applicable.

17.2 Design and construction

17.2.1 The equipment is to consist of a permanently fixed installation and at least two sets of portable equipment suitable for the process or products involved.

17.2.2 The position and number of fixed sampling points should be determined with due regard to the density of the gases and/or vapours of the substances processed or produced, and the dilution resulting from compartment ventilation. In each case, a sufficient number of sampling points is to be provided to give efficient selective sequential sampling to maintain a safe environment.

17.2.3 Unmanned or closed compartments, such as cofferdams, etc. associated with plant processing or producing flammable or toxic substances, are to have permanently installed sampling points suitable for use with portable detection equipment to be used before entry of the spaces by personnel and thereafter continuously while occupied by them.

17.2.4 Arrangements of the sampling point pipe runs are to be such that there is no possibility of hazardous gases and/or vapours entering a safe space. Common sampling lines to the detection equipment are not to be fitted.

17.2.5 The permanently installed gas detection system is to give audible and visible alarm, both in the control station and within the compartment, during hazardous conditions.

17.2.6 Except where continuous sampling is required (i.e. as in *Pt 7, Ch 2, 7.2 Safety precautions 7.2.5*), the gas detection equipment should be capable of sampling and analysing from each sampling point at agreed intervals, which are in no case to exceed 30 minutes.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 18

17.2.7 The gas detection equipment is to be designed so that it may be readily and regularly tested and calibrated. Suitable equipment and span gas is to be provided for this purpose. In addition, regular checking procedures with portable equipment are to be provided, particularly for closed or unmanned spaces during process plant operation.

17.2.8 Where equipment for detecting the specific flammable, toxic or asphyxiate substances which may be present in process plant spaces cannot be provided, full details are to be submitted, including personnel protection requirements and arrangements for decontaminating such spaces if necessary.

17.3 Installation

17.3.1 The gas detection system is to be installed to the Surveyor's satisfaction.

■ Section 18 Fire protection, detection and extinction

18.1 General

18.1.1 The requirements of SOLAS *Chapter II-2 - Construction - Fire protection, fire detection and fire extinction* and the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk, July 2021* are to be complied with, so far as they are applicable. Additional protection, consistent with the fire hazard involved, may be required for process plant control stations, and accommodation spaces. For the position of accommodation spaces relative to the process plant, see Pt 7, Ch 2, 6.2 *Location of accommodation, service and control spaces*.

18.1.2 Where the design of the process plant is such that it may be operated only while the vessel or floating structure is specially moored, anchored or otherwise linked close to the shore, consideration will be given to a shore-based fire-fighting facility, taking account of the particular hazards involved.

18.2 Design arrangements

18.2.1 Arrangements are to be made in enclosed process plant spaces to prevent contact of dangerously interreactive substances and of flammable materials with sources of ignition. In general, compartments containing process plant are not to exceed 40 m in length, and the boundary bulkheads are to be 'A' Class divisions.

18.2.2 Where, during operation, process plant spaces or adjacent hazardous zones contain or are likely to contain flammable and/or explosive mixtures, special consideration is to be given to the exclusion of all possible sources of ignition.

18.2.3 All heated surfaces, e.g. exhaust pipes, boiler uptakes and steam pipes, are to be effectively lagged or cooled, so that the maximum temperature, °C, of the surfaces is, in general, not to exceed 70 per cent of the auto-ignition temperature, °C, of any substances which may be present in the compartment. In no case is the difference in these temperatures to be less than 50°C.

18.2.4 Compartments where a fire hazard exists and which are not continuously manned are to be provided with an approved fire detection system which shall give visible and audible warning of the location of the fire in the control station and, for plant operating at sea (Category 1A), at the navigating bridge control position.

18.2.5 The fire main is to be so arranged, and hoses and nozzles provided, that any part of the compartments or structure associated with the process plant can be reached with two powerful jets of water, one of which shall be produced by a single length of hose. The hoses are to be provided with dual-purpose nozzles capable of producing a jet or a spray. Special consideration will be given to an exemption from this requirement in respect of compartments where the use of water would in itself constitute a hazard.

18.2.6 Each compartment where the fire hazard so demands is to be provided with an approved fixed fire-extinguishing system capable of extinguishing fires involving the materials present. Operation of such a system at its required output is not to prevent the simultaneous use of the required jets of water from the fire main. Where carbon dioxide systems and Halon systems are fitted, due consideration should be given to the danger of static electricity.

18.2.7 An adequate number of portable fire extinguishers are to be provided in each compartment where a fire hazard exists. The number of such extinguishers will be decided in relation to the nature of the hazard and the layout of the compartment, but shall not be less than two, one of which is to be positioned near the entrance. The extinguishing medium is to be considered in relation to the nature of the hazard involved.

Ships with Installed Process Plant for Chemicals, Liquified Gases and Related Products

Part 7, Chapter 2

Section 18

18.2.8 Means are to be provided for stopping all fans and, where practicable, closing all openings which might admit air to the compartment. Such means should be capable of being operated from a position outside the compartment and not likely to be rendered inaccessible by a fire in the compartment.

18.2.9 Means are to be provided for stopping the supply of combustible materials to the compartment in the event of fire.

18.2.10 The provision of additional fireman's outfits, each complying with the requirements of *10 Fire-fighter's outfits*, and the necessity for protective clothing, will be specially considered in relation to the layout of the process plant and the hazards involved.

Fire-fighting Ships

Part 7, Chapter 3

Section 1

Section

- 1 **General**
- 2 **Construction**
- 3 **Fire-extinguishing**
- 4 **Fire protection**
- 5 **Lighting**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships intended for fire-fighting operations and are additional to those applicable in other Parts.

1.1.2 A ship provided with fire protection and fire-fighting equipment in accordance with these Rules will be eligible for an appropriate class notation which will be recorded in the *Register Book*.

1.1.3 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the fire-fighting ship is intended to operate.

1.2 Classification and class notations

1.2.1 The class notations which may be assigned are:

- **'Fire-fighting ship 1** (total monitor discharge capacity in brackets)',
- **'Fire-fighting ship 2** (total monitor discharge capacity in brackets)',
- **'Fire-fighting ship 3** (total monitor discharge capacity in brackets)',
- **'Fire-fighting ship 1** (total monitor discharge capacity in brackets) **with water spray**',
- **'Fire-fighting ship 2** (total monitor discharge capacity in brackets) **with water spray**',
- **'Fire-fighting ship 3** (total monitor discharge capacity in brackets) **with water spray**'.

1.2.2 The notation **Fire-fighting ship 1**, **Fire-fighting ship 2** or **Fire-fighting ship 3** signifies that a ship complies with these Rules and is provided with the appropriate fire-fighting equipment described in *Table 3.1.1 Fire-fighting equipment*, with the total discharge capacity of monitors in m³/h shown in brackets.

1.2.3 The addition of the words **'with water spray'** to the notations referred to in *Pt 7, Ch 3, 1.2 Classification and class notations 1.2.1* signifies that a ship is provided with a water spray system, which will provide an effective cooling spray of water over the vertical surfaces of the ship to enable it to approach a burning installation for fire-fighting purposes. The requirements for such a system are set out in *Pt 7, Ch 3, 4.2 Water spray systems*.

Table 3.1.1 Fire-fighting equipment

Equipment	Fire-fighting ship		
	1	2	3
Minimum total pump capacity, m ³ /h	2400	7200	10 000
Minimum number of water monitors	2	3	4
Minimum discharge rate per monitor, m ³ /h	1200	1800	1800
Minimum height of trajectory of jets of monitors above sea level, metres	45	70	70

Fire-fighting Ships

Part 7, Chapter 3

Section 2

Minimum range of monitor jets, m	120	150	150
Minimum fuel capacity for monitors, hours	24	96	96
Number of hose connections each side of ship	4	8	8
Number of fireman's outfits	4	8	8

1.3 Surveys

1.3.1 The arrangements and equipment referred to in this Chapter are to be examined and tested under working conditions on completion of the installation and, subsequently, annually.

1.4 Submission of plans

1.4.1 The following plans and information are to be submitted:

- A general arrangement showing the disposition of all fire-fighting equipment required by this Chapter.
- Details of major items of fire-fighting equipment such as pumps and monitors, including their capacity, range and trajectory of delivery.
- A general arrangement plan showing the disposition of fire divisions and their class.
- Detailed plans of the fire divisions and, where applicable, copies of the certificates of approval for the insulating materials proposed.
- A plan of the construction of the fire doors.
- Plans showing the layout and capacity of the water spray system. Where alternative arrangements to those specified in *Pt 7, Ch 3, 4.2 Water spray systems* are proposed, evidence is to be submitted to satisfactorily demonstrate that an equivalent level of protection from radiated heat is provided, including details of the environmental conditions in which the ship is intended to operate, see *Pt 7, Ch 3, 4.2 Water spray systems 4.2.1*.
- A plan of the seating arrangements for the water monitors.
- Particulars of the means of keeping the ship in position during fire-fighting operations.
- A plan showing the fire pumps, the fire water main, the hydrants, hoses and hose nozzles and the monitors together with particulars of their delivery capability.
- Details of the fireman's outfits provided.
- Plans of any other fire-fighting systems provided.

1.5 Definitions

1.5.1 'A-60 standard' means a fire-resisting construction of steel or other equivalent material, which is suitably stiffened and so constructed as to be capable of preventing the passage of smoke and flame for the complete period of the one-hour standard fire test. It is to be insulated with approved non-combustible materials, so that the average temperature on the unexposed side will not rise by more than 139°C above the original temperature, nor will the temperature at any one point, including any joint, rise more than 180°C above the original temperature within 60 minutes.

■ Section 2 Construction

2.1 Hull

2.1.1 The ship may be constructed of steel or aluminium.

2.1.2 For ships with the class notation **Fire-fighting ship 1**, proposals to use uninsulated aluminium will be specially considered. Details of the measures taken to prevent the surface temperature of the aluminium being raised to an elevated level are to be submitted for approval. Such arrangements shall include water spray.

2.1.3 The structure of the ship is to be strengthened as necessary to withstand the forces imposed by the fire-extinguishing systems when operating at their maximum capacity.

Fire-fighting Ships

Part 7, Chapter 3

Section 3

2.2 Sea suction

2.2.1 The sea suction of the fire pumps are to be arranged as low as practicable in the ship's structure to avoid icing or the ingress of oil from the surface of the sea.

2.2.2 All sea inlet valves are to be provided with a low pressure steam or compressed air connection for clearing purposes.

2.3 Stability

2.3.1 Each ship is to comply with the draught and stability requirements of the National Authority and is to have on board sufficient stability data to enable the ship to be properly loaded and handled. This data is to take full account of the effect of the monitors when they are operating at their maximum output in all possible directions of use.

2.4 Manoeuvrability

2.4.1 Arrangements are to be provided to enable the ship to maintain position, so that the monitors may be effectively deployed.

2.5 Bunkering

2.5.1 The Owner should ensure that any fuel which may be required while the ship is operating on station can be safely received on board.

■ Section 3 Fire-extinguishing

3.1 Water monitors

3.1.1 The minimum number of monitors, their discharge rate, their range and their height of trajectory above sea level are to comply with the requirements of *Table 3.1.1 Fire-fighting equipment*.

3.1.2 The monitors are to be so arranged that the required direction, range and height of trajectory can be achieved separately, with the required number of monitors operating simultaneously.

3.1.3 The monitors are to be capable of adequate adjustment in the vertical and horizontal direction and are to be so positioned that the jets will be unimpeded within the required range of operation.

3.1.4 Means are to be provided for preventing the monitor jets from impinging on the ship's structure and equipment when in external fire fighting mode. Combined systems for high pressure external fire fighting and deck foam fire fighting may be permitted provided consideration is given to monitor position and to the safety of operating pressures when used in deck foam mode and during changeover between modes. Change over between modes is to be by a simple operator action. The combined system is to be capable of simple and rapid operation in either mode.

3.1.5 The monitors are to be capable of being activated and manoeuvred by remote control from a protected position providing a good view of the monitors and the operating area of the water jets.

3.1.6 The monitors are to be of robust construction and their seating arrangements are to be of adequate strength for all modes of operation, particular attention being paid to shock loading when all the monitors are activated simultaneously.

3.1.7 For the class notations **Fire-fighting ship 2** and **Fire-fighting ship 3**, an arrangement with one less monitor than required in *Table 3.1.1 Fire-fighting equipment* may be considered as an equivalent solution. In such cases the total pump capacity is to be as required in *Table 3.1.1 Fire-fighting equipment*. The minimum range of monitor jets and minimum height of trajectory of jets of monitors above sea level are to be 180 m and 110 m, respectively.

3.2 Pumps

3.2.1 The pumps and their piping system which are intended for serving the monitors are not to be available for services other than fire-extinguishing and water spraying. Each pump is to be provided with a dedicated independent sea chest.

3.2.2 Where the pumps are used for fixed water spray systems, the piping is to be independent of that supplying the monitors. The water spray systems are to be adequately protected against overpressure.

Fire-fighting Ships

Part 7, Chapter 3

Section 4

3.2.3 The minimum total pump capacities required are shown in *Table 3.1.1 Fire-fighting equipment*.

3.2.4 For assignment of the notations **Fire-fighting ship 2** or **Fire-fighting ship 3** there are to be at least two pumps serving the monitors and they should be of approximately equal capacity. For assignment of the notation **Fire-fighting ship 1** one pump only need be provided.

3.3 Hose stations

3.3.1 Hose stations are to be provided on each side of the ship in accordance with *Table 3.1.1 Fire-fighting equipment*.

3.3.2 Each hose station is to be provided with a hydrant, a hose and a nozzle capable of producing a jet or a spray and simultaneously a jet and a spray. The hoses are to be 15 m in length and not less than 38 mm nor more than 65 mm in diameter. Where hose stations are connected to the monitor supply lines, provision is to be made to reduce the water pressure at the hydrants to an amount at which each fire hose nozzle can be safely handled by one man. The water pressure shall be sufficient to produce a water jet throw of at least 12 m.

3.4 Fireman's outfits

3.4.1 The number of fireman's outfits provided, in addition to those provided in accordance with *Pt 6, Ch 4, 2 Fire detection, protection and extinction* or SOLAS Reg. II-2/C, 10 *Fire-fighter's outfits* as applicable is to be in accordance with *Table 3.1.1 Fire-fighting equipment*. They are to be stored in a safe position which is readily accessible from the open deck.

3.4.2 The composition of a fireman's outfit is to be as follows:

- Protective clothing of material to protect the skin from heat radiating from the fire and from burns and scalding by steam. The outer surface is to be water-resistant.
- Boots and gloves of rubber or other electrically non-conducting material.
- A rigid helmet providing effective protection against impact.
- An electric safety lamp (hand lantern) of an approved type with a minimum operating period of three hours.
- An axe having an insulated handle.
- A self-contained breathing apparatus, which is to be capable of functioning for a period of at least 30 minutes and having a capacity of at least 1200 litres of free air. Spare, fully charged air bottles are to be provided at the rate of at least one set per required apparatus.
- For each breathing apparatus, a fireproof lifeline of sufficient length and strength is to be provided capable of being attached by means of a snaphook to the harness of the apparatus or to a separate belt, in order to prevent the breathing apparatus becoming detached when the life-line is operated.

3.5 Recharging of equipment

3.5.1 A suitable air compressor for recharging the bottles used in the breathing apparatus of the fireman's outfits is to be provided. It is to be capable of recharging the bottles of the breathing apparatus required to be carried, in accordance with *Table 3.1.1 Fire-fighting equipment*, in a time not exceeding 30 minutes.

■ Section 4 Fire protection

4.1 General

4.1.1 In ships which are not provided with a water spray system as described in *Pt 7, Ch 3, 4.2 Water spray systems* all windows and port lights are to be provided with efficient deadlights or external steel shutters, except in the wheelhouse.

4.2 Water spray systems

4.2.1 Ships which are intended to operate in close proximity to a large fire will require protection from the heat radiated from the fire. Such protection may be afforded by a system which provides a water spray over the surface of the ship, or by a combination of insulation and a water spray system. Alternative arrangements providing an equivalent level of protection may be accepted where it can be demonstrated that such arrangements are effective for the environmental conditions in which the ship is intended to operate.

4.2.2 The water spray system is to be a fixed system which is capable of delivering a spray of water over all the exposed external vertical surfaces of the hull in the lightest sea-going condition, including the superstructures and deckhouses and over the monitor position. The water spray system will also be required to cover the areas of deck which form the crowns of machinery spaces and other spaces containing combustible materials.

4.2.3 The system is to have a capacity of 10 litres/min per m² of the protected area of uninsulated steel and 5 litres/min per m² of the protected area which is insulated internally to A-60 standard.

4.2.4 The system may be divided into sections, so that it will be possible to enable the closing down of those sections covering surfaces which are not exposed to radiant heat.

4.2.5 The nozzles are to be arranged to give an even distribution of water spray over the protected area.

4.2.6 The pumping capacity is to be sufficient to supply simultaneously at the required pressure the sections which serve the maximum area which may be exposed to radiant heat from a fire. If the main fire pumps are used for this purpose, they are to be capable of operating this system and the monitors and hose stations simultaneously at the required pressures, see also *Pt 7, Ch 3, 3.2 Pumps 3.2.2*.

4.2.7 Deck scuppers and freeing ports are to be of sufficient area to ensure efficient drainage of water from decks and horizontal surfaces in all conditions when the water spray system is in operation.

■ **Section 5** **Lighting**

5.1 General

5.1.1 Two searchlights should be provided for illuminating the burning structure and facilitate the effective deployment of the water monitors at night.

5.1.2 The searchlights are to be capable of providing at a range of 250 m in clear atmospheric conditions a level of illumination of 50 lux within an area of not less than 11 m diameter. They are to be capable of being adjusted in the horizontal and vertical directions.

Dynamic Positioning Systems

Part 7, Chapter 4

Section 1

Section

- 1 **General**
- 2 **Class notation DP(CM)**
- 3 **Class notation DP(AM)**
- 4 **Class notation DP(AA)**
- 5 **Class notation DP(AAA)**
- 6 **Performance Capability Rating (PCR)**
- 7 **Testing**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships with installed dynamic positioning systems and are additional to those applicable in other Parts of these Rules.

1.1.2 A ship provided with a dynamic positioning system in accordance with these Rules will be eligible for an appropriate class notation which will be recorded in the *Register Book*.

1.1.3 Requirements, additional to these Rules may be imposed by the National Administration with whom the ship is registered and/or by the administration within whose territorial jurisdiction it is intended to operate. Where national legislative requirements exist, compliance with such regulations shall also be necessary.

1.1.4 For the purpose of these Rules, dynamic positioning means the provision of a hydrodynamic system with automatic and/or manual control capable of maintaining the heading and position of the ship during operation within specified limits and environmental conditions.

1.1.5 For the purpose of these Rules, the area of operation is the specified allowable position deviation from a set point, see *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.2*.

1.1.6 Special consideration will be given where the dynamic positioning system is used primarily for purposes other than position keeping, e.g. track following. A descriptive note may be entered in column 6 of the *Register Book* to this effect.

1.2 Classification notations

1.2.1 Ships complying with the requirements of this Chapter will be eligible for one of the following class notations, as defined in *Pt 1, Ch 2 Classification Regulations*:

- (a) **DP(CM)** See *Pt 7, Ch 4, 2 Class notation DP(CM)*.
- (b) **DP(AM)** See *Pt 7, Ch 4, 3 Class notation DP(AM)*.
- (c) **DP(AA)** See *Pt 7, Ch 4, 4 Class notation DP(AA)*.
- (d) **DP(AAA)** See *Pt 7, Ch 4, 5 Class notation DP(AAA)*.

1.2.2 The notations given in *Pt 7, Ch 4, 1.2 Classification notations 1.2.1* may be supplemented with a Performance Capability Rating (**PCR**). This rating indicates the calculated percentage of time that a ship is capable of maintaining heading and position under a standard set of environmental conditions (North Sea), see *Pt 7, Ch 4, 6 Performance Capability Rating (PCR)*.

1.2.3 Additional descriptive notes may be entered in column 6 of the *Register Book* indicating the type of position reference system, control system, etc.

1.2.4 Where a **DP** notation is not requested, dynamic positioning systems are to be installed in accordance with the requirements of *Pt 7, Ch 4, 2 Class notation DP(CM)* as far as is practicable.

1.3 Information and plans required to be submitted

1.3.1 The information and plans specified in *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.2* to *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.7* are to be submitted in triplicate. The Operation Manuals specified in *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.9* are to be submitted in a single set.

1.3.2 Details of the limits of the area of operation and heading deviations, together with proposals for redundancy and segregation provided in the machinery, electrical installations and control systems, are to be submitted. These proposals are to take account of the possible loss of performance capability should a component fail or in the event of fire or flooding, see *also Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.6* and *Pt 7, Ch 4, 4 Class notation DP(AA)* and *Pt 7, Ch 4, 5 Class notation DP(AAA)*.

1.3.3 Where a common power source is utilized for thrusters, details of the total maximum load required for dynamic positioning are to be submitted.

1.3.4 Plans of the following, together with particulars of ratings in accordance with the relevant Parts of the Rules, are to be submitted for:

- (a) Prime movers, gearing, shafting, propellers and thrusters.
- (b) Machinery piping systems.
- (c) Electrical installations.
- (d) Pressure vessels for use with dynamic positioning system.

1.3.5 Plans of control, alarm and safety systems, including the following, are to be submitted:

- (a) Functional block diagrams of the control system(s).
- (b) Functional block diagrams of the position reference systems and the environmental sensors.
- (c) Details of the electrical supply to the control system(s), the position reference system(s) and the environmental sensors.
- (d) Details of the monitoring functions of the controllers, sensors and reference systems, together with a description of the monitoring functions.
- (e) List of equipment with identification of the manufacturer, type and model.
- (f) Details of the control stations, e.g. control panels and consoles, including the location of the control stations.
- (g) Test schedules (for both works testing and sea trials) that are to include the methods of testing and the test facilities provided.

1.3.6 For assignment of **DP(AA)** or **DP(AAA)** notation, a Failure Mode and Effects Analysis (FMEA) is to be submitted, demonstrating that adequate segregation and redundancy of the machinery, the electrical installation and the control systems have been achieved in order to maintain position in the event of equipment failure (see *Pt 7, Ch 4, 4 Class notation DP(AA)*); or fire or flooding, see *Pt 7, Ch 4, 5 Class notation DP(AAA)*. The FMEA is to take a formal and structured approach and is to be performed in accordance with an acceptable and relevant national or international standard, e.g. IEC 60812.

1.3.7 Where the DP notation is to be supplemented with a Performance Capability Rating (**PCR**) (see *Pt 7, Ch 4, 1.2 Classification notations 1.2.2*), the following information is to be submitted for assignment of a PCR:

- (a) Lines plan.
- (b) General arrangement.
- (c) Details of thruster arrangement.
- (d) Thruster powers and thrusts.

1.3.8 Details of the intended modes of operation are to be submitted. As a minimum, these are to include:

- (a) a description of all the intended operating modes;
- (b) details of the system configuration required for each mode of operation. When applicable, this is to include the configuration needed to meet the FMEA requirements of *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.6*; and
- (c) the procedures which are to be followed in each operating mode during normal and abnormal conditions.

1.3.9 A set of the operation and maintenance manuals is to be placed and retained on board the ship.

■ Section 2

Class notation DP(CM)

2.1 General

2.1.1 For assignment of **DP(CM)** notation, the requirements of *Pt 7, Ch 4, 2.1 General 2.1.2* and *Pt 7, Ch 4, 2.2 Thrusters to Pt 7, Ch 4, 2.5 Control system* are to be complied with.

2.1.2 Control engineering systems, electrical and piping installations and machinery items are to be designed, constructed, installed and tested in accordance with the relevant requirements of *Pt 5 Main and Auxiliary Machinery* and *Pt 6 Control, Electrical, Refrigeration and Fire*.

2.2 Thrusters

2.2.1 Thruster installations are to be designed, constructed, installed and tested in accordance with the requirements of *Pt 5, Ch 20 Azimuth Thrusters*, as applicable.

2.2.2 Thruster installations are to be designed to minimize potential interference with other thrusters, sensors, hull or other surfaces, which could be encountered in the service for which the ship is intended.

2.2.3 Thruster intakes are to be located at sufficient depth to reduce the possibility of ingesting floating debris and vortex formation.

2.2.4 The response and repeatability of thrusters to changes in propeller pitch or propeller speed/direction of rotation are to be suitable for maintaining the area of operation and heading within specified limits.

2.2.5 Failure of a thruster system including pitch, azimuth and/or speed control is not to cause an increase in thrust magnitude or change in thrust direction of the failed thruster.

2.2.6 Thrusters are to be provided with individual emergency stop systems in the DP control station. The emergency stop system is to be provided with loop monitoring facilities that will initiate an alarm in accordance with the requirements of *Pt 6, Ch 1, 2.3 Alarm systems, general requirements*. In the event that the loop monitoring alarm is initiated the thruster output is to remain unaltered.

2.2.7 Alternative energy storage (e.g. batteries and fly-wheels) may be used as sources of power to thrusters.

2.3 Electrical systems

2.3.1 This Section applies to the electrical generation and distribution system associated with the Dynamic Positioning System, whether this generating system is dedicated to the DP system or forms a central generating arrangement for all loads on the ship.

2.3.2 The electrical installation is to be designed, constructed and installed, in accordance with the requirements of *Pt 6, Ch 2 Electrical Engineering*, together with the requirements of *Pt 7, Ch 4, 2.3 Electrical systems 2.3.3* to *Pt 7, Ch 4, 2.3 Electrical systems 2.3.12*.

2.3.3 Where thrusters are electrically driven, the relevant requirements, including surveys, of *Pt 6, Ch 2, 16 Electric propulsion* are to be complied with.

2.3.4 Essential services are those defined in *Pt 6, Ch 2, 1.6 Definitions*, as applicable, together with thruster auxiliaries, computers, generator and thruster control equipment, reference systems, environmental sensors and electrically driven thrusters.

2.3.5 The number and rating of generator sets, transformers and converter equipment are to be sufficient to ensure the operation of essential services, even when one generating set, transformer or converter equipment is out of action.

2.3.6 For electrically driven thruster systems, the generator rating is to be determined by the maximum dynamic positioning load, together with the maximum ancillary load.

2.3.7 There are to be arrangements to prevent overloading of the running generator(s). The tripping of non-essential loads and the temporary reduction in the load demands of electrically driven thrusters may form part of these arrangements. The arrangements are to ensure that sudden load changes resulting from single faults or equipment failures do not create a loss of electrical supplies.

Dynamic Positioning Systems

Part 7, Chapter 4

Section 2

2.3.8 An alarm is to be initiated when the total electrical load exceeds a preset percentage of the running generator(s) capacity. This alarm is to be adjustable between 50 and 100 per cent of the running capacity and is to be set with regard to the number of generators in service and the effect of the loss of any one generator.

2.3.9 On loss of power due to the failure of the operating generator(s), there is to be provision for the automatic starting and connection to the switchboard of a standby set and the automatic sequential restarting of essential services. Consideration may be given to cases where arrangements for automatic re-starting of thrusters would not be practicable. Details are to be submitted in such cases to show that manual means for the immediate re-starting of thrusters would be available at the control station from where the dynamic positioning system would be operated.

2.3.10 Any loads that require an uninterrupted electrical power supply are to be provided with uninterruptible power systems (UPS) having a capacity for a minimum of 30 minutes' operation following loss of the main supply. A UPS is to be provided for each control computer system.

2.3.11 An indication of the absorbed power and the available on-line generating capacity is to be provided at the main dynamic positioning control station.

2.3.12 Essential services are to be served by individual circuits. Essential services that are duplicated are:

- (a) to be supplied from independent sections of their switchboard or section board;
- (b) to have their circuits separated throughout their length as widely as is practicable; and
- (c) not to depend upon common feeders, transformers, converters, protective devices, control circuits or controlgear assemblies to operate.

2.4 Control stations

2.4.1 Control stations from which the dynamic positioning system may be operated are to be designed in accordance with sound ergonomic principles, and are to be provided with sufficient instrumentation to provide effective control and indicate that the systems are functioning correctly. Colour schemes and screen layouts are to be selected such that necessary information is readily available and clearly displayed. *See also Pt 6, Ch 1, 2.10 Programmable electronic systems - General requirements* for general ergonomic requirements.

2.4.2 Control station(s) are to be located such that the operator has a good view of the ship's exterior limits and surrounding area.

2.4.3 Indication of the following is to be provided at each station from which it is possible to control the dynamic positioning system:

- (a) The heading and location of the ship relative to the desired reference point or course.
- (b) Vectorial thrust output, individual and total.
- (c) Operational status of position reference systems and environmental sensors.
- (d) Environmental conditions, e.g. wind speed and direction.
- (e) Availability status of standby thrusters.

2.4.4 At least one position reference system, heading reference sensor and wind sensor are to be provided to ensure that the specified area of operation and heading can be effectively maintained.

2.4.5 Position reference systems are to incorporate measurement techniques suitable for the service conditions for which the ship is intended.

2.4.6 Where necessary for the correct functioning of a position reference system, a vertical reference sensor is to be provided to correct for the pitch and roll of the ship. There are to be at least as many vertical reference units as there are associated position reference systems.

2.4.7 Alarms, in accordance with the requirements of *Pt 6, Ch 1, 2.3 Alarm systems, general requirements*, are to be provided for the following fault conditions as applicable:

- (a) When the ship deviates from the area of operation.
- (b) When the heading exceeds the allowable deviation.
- (c) Position reference system fault (for each reference system).
- (d) Heading reference sensor fault.
- (e) Vertical reference sensor fault.
- (f) Wind sensor fault.

- (g) Taut wire excursion limit.
- (h) Automatic changeover to a standby position reference system or environmental sensor.

A record of the occurrences of alarms and warnings, and of status changes is to be provided.

2.5 Control system

- 2.5.1 A centralised remote manual control system is to be provided such that changes in the vectorial thrust output may be readily effected by a single operator action.
- 2.5.2 Suitable processing and comparative techniques are to be provided to validate the control system inputs from position and other sensors. Abnormal signal errors revealed by the validity checks are to operate alarms.
- 2.5.3 The control system for dynamic positioning operation is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.
- 2.5.4 Automatic controls are to be provided to maintain the heading of the ship within specified limits.
- 2.5.5 The allowable deviation from the desired heading is to be adjustable, but should not exceed the specified limits, see *Pt 7, Ch 4, 1.1 Application 1.1.4*. Arrangements are to be provided to fix and identify the set point for the desired heading.
- 2.5.6 Alarms, in accordance with the requirements of *Pt 6, Ch 1, 2.3 Alarm systems, general requirements*, are to be provided for the following fault conditions:
- (a) Control computer system fault.
 - (b) Automatic changeover to a standby control computer system, as applicable, see *Pt 7, Ch 4, 4.1 Requirements 4.1.8*.
- 2.5.7 Safeguards are to be implemented to ensure the integrity of the control system by preventing the connection of unauthorised or unapproved devices or systems.
- 2.5.8 Where external forces from mission-related systems (cable laying, pipe laying, mooring, etc.) have a direct impact on DP performance, the influence of these systems is to be considered within the DP control system design:
- (a) data inputs from the mission-related system are to be provided automatically to the DP control system; and
 - (b) provision is to be made to provide such data inputs into the DP control system manually.

■ **Section 3** **Class notation DP(AM)**

3.1 Requirements

- 3.1.1 For assignment of **DP(AM)** notation the applicable requirements of *Pt 7, Ch 4, 2 Class notation DP(CM)* together with *Pt 7, Ch 4, 3.1 Requirements 3.1.2 to Pt 7, Ch 4, 3.1 Requirements 3.1.6*, are to be complied with.
- 3.1.2 An automatic and a manual control system are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative. Arrangements for manual control are to satisfy the requirements of *Pt 7, Ch 4, 2 Class notation DP(CM)* when the automatic system is inoperative.
- 3.1.3 At least two position reference systems suitable for the intended service conditions and incorporating different measurement techniques, are to be provided and arranged, so that a failure in one system will not render the other system inoperative. Special consideration will be given where the use of different techniques would not be practicable during DP operations.
- 3.1.4 At least two heading reference sensors and two wind sensors are to be provided and arranged, so that a failure of one sensor will not render the other sensor(s) inoperative.
- 3.1.5 In the event of a single failure of a position reference, heading reference, or wind sensor, the control systems are to continue operating on signals from the remaining sensors without manual intervention.
- 3.1.6 The area of operation is to be adjustable, but is not to exceed the specified limits based on a percentage of water depth, or as applicable, a defined absolute or relative surface movement. Arrangements are to be provided to fix and identify the set point for the area of operation.

■ Section 4

Class notation DP(AA)

4.1 Requirements

4.1.1 For assignment of **DP(AA)** notation, the applicable requirements of *Pt 7, Ch 4, 2 Class notation DP(CM)* and *Pt 7, Ch 4, 3 Class notation DP(AM)*, together with *Pt 7, Ch 4, 4.1 Requirements 4.1.2* to *Pt 7, Ch 4, 4.1 Requirements 4.1.11* are to be complied with.

4.1.2 Power, control and thruster systems and other systems necessary for, or which could affect, the correct functioning of the DP system are to be provided and configured such that a fault in any active component or system will not result in a loss of position. This is to be verified by means of a FMEA, see *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.6*. Such components may include, but are not restricted to, the following:

- Prime movers (e.g. auxiliary engines).
- Generators and their excitation equipment.
- Gearing.
- Pumps.
- Fans.
- Switchgear and controlgear, including their assemblies.
- Thrusters.
- Valves (where power actuated).

Systems which are not part of the DP system but which, in the event of a fault, could affect the correct functioning of the DP system (for example, fire suppression systems, engine ventilation systems, shutdown systems, etc.) are to be included in the FMEA.

4.1.3 Cables, pipes and other components essential for correct functioning of the DP system are to be located and protected, where necessary, such that the risk of fire or mechanical damage is minimised.

4.1.4 The electrical generation and distribution arrangements are to be isolatable such that at least the minimum number of any duplicated, or otherwise replicated, items required to provide essential services would remain operational in the event of a single fault. Evidence to verify compliance with this requirement is to be submitted for consideration when required; for example, where it is intended to operate with the independent sections required by *Pt 7, Ch 4, 2.3 Electrical systems 2.3.12* connected together.

4.1.5 Where the independent switchboards or section boards required by *Pt 7, Ch 4, 2.3 Electrical systems 2.3.12* are to be connected together, this is to be via two multipole circuit-breakers connected in series. Where alternative arrangements are proposed, these may be accompanied by a technical justification showing compliance with *Pt 7, Ch 4, 4.1 Requirements 4.1.4*.

4.1.6 For electrically driven thruster systems:

- (a) a reduction in position keeping capability may be accepted, but this is not to result in a loss of position in the environmental conditions in which the DP system is intended to operate; and
- (b) provision is to be made for the automatic starting, synchronising and load sharing of a non-running generator before the load reaches the alarm level required by *Pt 7, Ch 4, 2.3 Electrical systems 2.3.8*.

4.1.7 Two automatic control systems are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative.

4.1.8 Control systems are to be arranged such that, in the event of failure of the working control system, the standby system takes control automatically without manual intervention and without any adverse effect of the ship's station keeping performance.

4.1.9 At least three position reference systems incorporating at least two different measurement techniques are to be provided and arranged so that a failure in one system will not render the other systems inoperative.

4.1.10 At least three heading reference sensors are to be provided and arranged so that a failure of one sensor will not render the other sensors inoperative.

4.1.11 The DP system is to incorporate a computer based consequence analysis to determine whether the position of the vessel would remain within the limits set by the operator in the event of a worst case fault. An audible and visual alarm is to be

initiated where the consequence analysis determines that the limits would be exceeded. Where applicable to the timescale for safely terminating operations, the consequence analysis is to allow for manual input of predicted environmental conditions.

4.1.12 The DP system is to include monitoring of all devices where the FMEA shows that the loss of the device will result in the loss of redundancy provision. Such monitoring is to be provided for all devices where the loss has the potential for failure of equipment to perform an on-demand function, such as protective functions in electrical systems and switchboards, standby equipment, or backup power supplies. The monitoring is to initiate an alarm in accordance with the requirements of *Pt 6, Ch 1, 2.3 Alarm systems, general requirements*.

■ Section 5

Class notation DP(AAA)

5.1 Requirements

5.1.1 For assignment of **DP(AAA)** notation, the applicable requirements of *Pt 7, Ch 4, 2 Class notation DP(CM)*, *Pt 7, Ch 4, 3 Class notation DP(AM)* and *Pt 7, Ch 4, 4 Class notation DP(AA)*, together with *Pt 7, Ch 4, 5.1 Requirements 5.1.2 to Pt 7, Ch 4, 5.1 Requirements 5.1.3* are to be complied with.

5.1.2 The DP system is to be arranged such that failure of any component or system necessary for the continuing correct functioning of the DP system, or the loss of any one compartment as a result of fire or flooding, will not result in a loss of position. This is to be verified by means of a FMEA. *See Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.6.*

5.1.3 Thruster units are to be installed in separate machinery compartments, separated by a watertight A-60 class division.

5.1.4 Generating sets, switchboards and associated equipment are to be located in at least two compartments separated by an A-60 class division, so that at least half of the equipment will be available following a fire or similar fault in one of the compartments. If the equipment is located below the operational waterline, the division is also to be watertight. There is to be provision to connect the switchboard sections together by means of circuit-breakers.

5.1.5 Duplicated cables and pipes for services essential for the correct functioning of the DP system are not to be routed through the same compartments. If this is not practicable, then they are to be carried in A-60 protected ducts. The termination arrangements are also to take due account of the degree of protection. Alternative arrangements will be considered.

5.1.6 Where duplicated cables and pipes for services essential for the correct functioning of the DP system are installed in adjacent compartments, A-60 rated fire protection is to be provided between the spaces. Details of alternative arrangements which demonstrate essential equipment located in an adjacent space will continue to operate satisfactorily and essential services will continue to be available in the event of a fire in the adjacent space may be submitted for consideration.

5.1.7 An additional/emergency automatic control unit is to be provided at an emergency control station, in a compartment separate from that for the main control station, and is to be arranged to operate independently from the working and standby control units required by *Pt 7, Ch 4, 4.1 Requirements 4.1.8*.

5.1.8 Arrangements are to be provided such that, in the event of a failure of the working and standby control units, a smooth transfer of control to the emergency control unit may be effected from the emergency control station by manual means.

5.1.9 Arrangements are to be provided at the emergency control station so that changes in the resultant vectorial thrust output may be readily effected by a single operator action.

5.1.10 The control/indication unit of one of the position reference systems required by *Pt 7, Ch 4, 4.1 Requirements 4.1.9* is to be located at the emergency control station. A repeater control/indication unit from this system is to be located at the main control station.

5.1.11 One of the heading reference sensors required by *Pt 7, Ch 4, 4.1 Requirements 4.1.10* is to be located at the emergency control station.

5.1.12 One wind sensor is to directly supply the additional/emergency control unit.

5.1.13 The additional/emergency control unit is to be supplied from its own independent UPS, *see Pt 7, Ch 4, 2.3 Electrical systems 2.3.10*.

■ Section 6

Performance Capability Rating (PCR)

6.1 Requirements

6.1.1 Where the **DP** notation is to be supplemented with a Performance Capability Rating (PCR) (see *Pt 7, Ch 4, 1.2 Classification notations 1.2.2*), the calculation will be carried out using the information specified in *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.7*.

6.1.2 Two rating numerals are calculated:

- (a) The first numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with all thrusters operating.
- (b) The second numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with the most effective thruster being inoperative.

A typical rating might be (95), (70).

6.1.3 In calculating the PCR, the following parameters are considered:

- (a) Thruster force vectors.
- (b) Thruster/thruster, thruster/hull and thruster/current interactions.
- (c) Sea current loads on the ship.
- (d) Wind force on the ship.
- (e) Wave drift force on the ship.

6.1.4 Where the ship has been subject to alteration or addition, which may affect the performance characteristics of the DP system, the PCR is to be recalculated.

■ Section 7

Testing

7.1 General

7.1.1 Control units are to be surveyed at the manufacturer's works and are to be tested in accordance with the approved test schedule to the Surveyor's satisfaction, see *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.5.(g)*.

7.1.2 Before a new installation (or any existing installation, which has been subject to alteration or addition which may affect the performance characteristics of the system) is put into service, sea trials are to be carried out to the approved schedule and to the Surveyor's satisfaction, see *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.5.(g)*.

7.1.3 The suitability of the dynamic positioning system is to be demonstrated during sea trials, observing the following:

- (a) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power, verifying the findings of the FMEA where required.
- (b) Response of the system under a set of predetermined manoeuvres for changing:
 - (i) Location of area of operation.
 - (ii) Heading of the ship.
- (c) Continuous operation of the system over a period of four to six hours.

7.1.4 Two copies of the dynamic positioning sea trial test schedules, as required by *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.5.(g)*, each signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed and retained on board the ship and the other submitted to LR.

7.1.5 Records and data regarding the performance capability of the dynamic positioning system are to be maintained on board the ship and are to be made available at the time of the Annual Survey, see *Pt 1, Ch 3, 2.2 Annual Surveys 2.2.26*.

Section

- 1 **General**
- 2 **Oil recovery**
- 3 **Ship structure**
- 4 **Machinery arrangements**
- 5 **Electrical equipment**
- 6 **Fire protection and extinction**
- 7 **Operating Manual**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships equipped to handle, store and transport oil recovered from a spill in emergency situations.

1.1.2 For ships of less than 500 gross tons, also fishing vessels of 12 m length and over, but less than 45 m length, and ships not fitted with propelling machinery, the arrangements for fire protection and extinction are to comply with *Pt 7, Ch 5, 6 Fire protection and extinction*. Consideration will be given to the acceptance of the fire safety measures for oil recovery ships prescribed and approved by the Government of the Flag State.

1.1.3 For ships of 500 gross tons and over, also fishing vessels of 45 m length and over, it is the responsibility of the Government of the Flag State to give effect to the fire safety measures, *see Pt 6, Ch 4, 1.1 Application*. Where the Government of the Flag State has no National Requirements for oil recovery ships, LR will apply the fire safety measures required by *Pt 7, Ch 5, 6 Fire protection and extinction* for classification purposes.

1.1.4 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.2 Classification and class notations

1.2.1 A ship complying with the applicable requirements of this Chapter will be eligible for the notation **Oil Recovery** or **Oil Recovery (F.P. >60°C)** as appropriate.

1.2.2 A ship dedicated solely to oil recovery duties and complying with the requirements of this Chapter applicable to the **Oil Recovery** notation will be assigned the class notation **Oil Recovery Ship**. The scantlings will be specially considered on the basis of the requirements of *Pt 4, Ch 9 Double Hull Oil Tankers*.

1.3 Surveys

1.3.1 The arrangements and equipment referred to in this Chapter are to be examined and tested on completion of the installation and, subsequently, annually.

1.4 Plans and supporting documentation

1.4.1 In addition to the supporting documentation required for classification as specified in other Parts of the Rules, details relevant to oil recovery operations are to be submitted.

1.4.2 Plans covering the following items are to be submitted for approval:

- Structural support in way of equipment.
- Structural arrangement of recovered oil tanks including access.
- Piping system arrangements for recovered oil including venting.

- Power supply, electrical protection and cabling for oil recovery equipment.
- Hazardous areas and spaces (not applicable for the notation **Oil Recovery (F.P. >60°C)**).
- Electrical equipment located in hazardous areas and spaces (not applicable for the notation **Oil Recovery (F.P. >60°C)**).
- Structural fire protection and extinguishing equipment.

1.4.3 The following supporting documents are to be submitted:

- General arrangement of recovery equipment, including portable items, handling facilities, access, ventilation details, arrangement of other openings to hazardous spaces and adjacent compartments, machinery exhaust outlet positions.
- Gas detection equipment specification.
- Operating Manual.

1.4.4 The following supporting calculations are to be submitted:

- Deck equipment support structure loadings.
- Schedule of loads on the electrical system for oil recovery operations.

■ **Section 2** **Oil recovery**

2.1 General

2.1.1 The ship is to be capable of performing the following functions at a safe distance from the source of oil spill:

- Removal of the oil from the surface of the sea.
- Handling, storage and transportation of the recovered oil.

2.2 Equipment and deck arrangement

2.2.1 The arrangements for collection, handling and transfer of recovered oil are to be such that the probability of oil spill on deck and overflow is minimised and the operation is to be performed as far away from the accommodation spaces as practicable.

2.2.2 In way of working areas, hand rails and gratings or other non-slip surfaces are to be provided.

2.2.3 Means are to be provided to keep deck spills away from the accommodation and service areas. This may be accomplished by provision of a permanent continuous coaming not less than 150 mm high.

2.2.4 For assignment of the notations **Oil Recovery** or **Oil Recovery Ship**, at least two portable instruments for measuring flammable vapour concentrations in air (percentage Lower Explosive Limit (%LEL)) are to be available on board.

2.2.5 For engines used in oil recovery operations, see *Pt 7, Ch 5, 4.4 Exhaust systems*.

2.2.6 Masts and derricks, etc. are to comply with the appropriate Sections of Chapters *Ch 2 Derrick Systems* and *Ch 3 Launch and Recovery Appliances for Survival Craft and Rescue Boats* of LR's *Code for Lifting Appliances in a Marine Environment, July 2021*.

■ **Section 3** **Ship structure**

3.1 Structural arrangement

3.1.1 The position of bulkheads is to comply with the requirements of *Pt 3, Ch 3, 4 Bulkhead requirements*.

3.1.2 Any tanks not utilised during oil recovery operations are to be arranged so that recovered oil cannot be transferred to them inadvertently.

3.1.3 In tanks intended for recovered oil, internal obstructions are to be avoided as far as practicable to prevent the entrapment of foreign objects usually present in recovered oil. Adequate drainage openings are to be provided to ensure free flow of residues to assist in cleaning and gas freeing on completion of recovery operations.

3.1.4 Tanks used for the storage of recovered oil are to be located outside the accommodation and machinery spaces.

3.1.5 Except where permitted by *Pt 7, Ch 5, 3.1 Structural arrangement 3.1.6* and *Pt 7, Ch 5, 3.1 Structural arrangement 3.1.7*, tanks intended for the storage of recovered oil are to be separated from accommodation and machinery spaces by cofferdams. Cofferdams are to be at least one frame spacing in length (600 mm minimum) and are to cover the whole area of the boundary under consideration.

3.1.6 A pump room, fuel oil bunker, water ballast tank or other closed space where oil recovery handling equipment is stored will be accepted in lieu of a cofferdam.

3.1.7 In the case of a ship not primarily intended for oil recovery operations, where cofferdams are impractical to arrange, tanks arranged adjacent to machinery spaces may be accepted for storage of recovered oil. Acceptance will be conditional upon the tank boundary bulkheads being readily accessible for inspection. The bulkheads are to be carried continuously through joining structure to the top of the tank, where full penetration welding is to be carried out. Such tanks will require to be pressure tested at every Periodical Survey, see *Table 1.9.1 Testing requirements* in *Pt 3, Ch 1*, as applicable to oil tankers. Special consideration will be given to arrangements incorporating double bottom tanks in these locations.

3.1.8 All openings to tanks for recovered oil are to be located on the open deck. This includes sounding pipes, vent pipes, and hatches for the deployment of portable pumps and hoses. Suitable access hatches, not less than 600 mm x 600 mm, are to be arranged to facilitate tank cleaning and gas freeing. Dual access hatches, as widely separated as practicable, are to be provided for tanks of a cellular internal structure.

3.1.9 Where there is a risk of significant sloshing induced loads, additional strength calculations may be required, see *Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks*.

3.1.10 Where recovered oil temperatures are to be increased significantly above 65°C during transit voyages, attention is drawn to *Pt 4, Ch 9, 12 Cargo temperatures* regarding thermal stress considerations.

3.2 Scantlings

3.2.1 The scantlings and arrangements are, in general, to be as required by *Pt 4, Ch 1 General Cargo Ships*. If the ship is to perform the duties of a supply ship the requirements of *Pt 4, Ch 4 Offshore Support Vessels* are also to be complied with, as applicable.

■ Section 4 Machinery arrangements

4.1 Piping arrangements

4.1.1 Piping arrangements for the recovered oil system are to be located outside machinery spaces and are to have no connections to such spaces.

4.1.2 When the ship is in oil recovery mode, means are to be provided to isolate the oil recovery system from any other system to which it may be connected.

4.1.3 For assignment of the notations **Oil Recovery** or **Oil Recovery Ship**, ventilation outlets from the recovered oil tanks are to have a minimum height of 2,4 m above deck and be fitted with flame screens. Temporary pipe sections may be used for this purpose. Outlets are to be located not less than a 5 m radius from the nearest air intakes and openings to accommodation and enclosed spaces containing a source of ignition and from deck machinery and equipment which may constitute an ignition hazard.

4.1.4 Each recovered oil tank is to be fitted with suitable means of ascertaining the liquid level in the tank. Sounding pipes or other approved devices are acceptable for this purpose.

4.2 Pump room for recovered oil

4.2.1 Pump rooms are to be fitted with a permanent ventilation system of the mechanical extraction type.

4.2.2 The ventilation system is to be capable of being operated from outside the compartment being ventilated and a notice is to be fixed near the entrance stating that no person is to enter the space until the ventilation system has been in operation for a specified period, sufficient to achieve at least five air changes based on the gross volume of the space.

4.2.3 The ventilation system is to be capable of at least six air changes per hour, based on the gross volume of the space.

4.2.4 Protection screens of not more than 13 mm square mesh are to be fitted outside openings of ventilation ducts, and ventilation intakes are to be so arranged as to minimise the possibility of recycling hazardous vapours from any ventilation discharge opening. Vent exhausts are to be arranged to discharge to a safe place on the open deck and comply with the requirements of *Pt 7, Ch 5, 4.2 Pump room for recovered oil 4.2.5*.

Note If the pump room is designed to recover chemicals listed in *Chapter 17 Summary of minimum requirements of the IBC Code - International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk* Amended by *Resolution MEPC.225(64)* the vent exhausts are to be arranged to discharge upwards.

4.2.5 The vent exhausts from pump rooms are to discharge at least 3 m above deck, and from the nearest air intakes or openings to accommodation and enclosed working spaces, and from possible sources of ignition.

4.2.6 Ventilation fans to be constructed in accordance with *Pt 5, Ch 15, 1.8 Cargo pump-room ventilation*.

4.2.7 Pump rooms are to have no direct communication with machinery spaces.

4.2.8 The requirements of *Pt 7, Ch 5, 4.2 Pump room for recovered oil 4.2.1* to *Pt 7, Ch 5, 4.2 Pump room for recovered oil 4.2.6* are not applicable for assignment of the notation **Oil Recovery (F.P. >60°C)**.

4.2.9 Pump rooms for recovered oil on board ships to be assigned the notation **Oil Recovery (F.P. >60°C)** are to satisfy the relevant requirements of *Pt 5, Ch 1, 4.5 Ventilation*.

4.2.10 Bilge drainage of the pump room is to be effected by pumps or bilge ejector suctions. For ships of less than 500 gross tons, the pump room bilge may be drained by a hand pump having a 50 mm bore suction.

4.3 Ventilation of machinery spaces

4.3.1 Where machinery spaces adjacent to recovered oil tanks are permitted by *Pt 7, Ch 5, 3.1 Structural arrangement 3.1.7*, the ventilation arrangements are to comply with *Pt 7, Ch 5, 5.4 Ventilation 5.4.1* and *Pt 7, Ch 5, 5.4 Ventilation 5.4.1.(b)*.

4.4 Exhaust systems

4.4.1 For assignment of the notations **Oil Recovery**, **Oil Recovery Ship** or **Oil Recovery (F.P. >60°C)**, the exhaust lines of engines, boilers and equipment containing sources of ignition and the vents of engine crank cases are to be fitted with suitable spark arrestors.

4.4.2 For assignment of the notations **Oil Recovery** or **Oil Recovery Ship**, the exhaust lines of engines, boilers and equipment containing sources of ignition and the vents of engine crank cases are to be led to a position outside any hazardous area as defined in *Pt 7, Ch 5, 5.3 Hazardous areas*.

4.4.3 For assignment of the notation **Oil Recovery (F.P. >60°C)**, the exhaust lines of engines, boilers and equipment containing sources of ignition and the vents of engine crank cases are to be fitted with suitable spark arrestors.

4.5 Miscellaneous

4.5.1 Low sea suctions are to be provided to supply water for the machinery and all fire pumps.

4.5.2 Means are to be provided to enable heating coils in recovered oil tanks and adjacent tanks to be blanked off during recovery operations.

4.5.3 The heating medium supply and return lines are not to penetrate the recovered oil tank plating, other than at the top of the tank, to reduce the possibility of the recovered oil entering the heating system in the event of a failure of the heating pipework within the tank.

4.5.4 If required to facilitate discharge operations, steam returns are to be led to an observation tank which is to be in a well-ventilated and well-lighted part of the machinery space remote from the boilers.

■ Section 5

Electrical equipment

5.1 General

5.1.1 The electrical installation is to comply with the relevant requirements of *Pt 6, Ch 2 Electrical Engineering*, with the specific exceptions of *Pt 6, Ch 2, 14.1 General*, *Pt 6, Ch 2, 14.3 Selection of equipment for use in explosive gas atmospheres*, *Pt 6, Ch 2, 14.7 Ventilation*, *Pt 6, Ch 2, 14.8 Pressurisation* and *Pt 6, Ch 2, 14.10 Requirements for tankers intended for the carriage in bulk*, which are replaced by *Pt 7, Ch 5, 5.3 Hazardous areas* to *Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas* of this Chapter.

5.1.2 The requirements of *Pt 7, Ch 5, 5 Electrical equipment* are not applicable for assignment of the notation **Oil Recovery (F.P. >60°C)**.

5.1.3 The electrical installations on board ships to be assigned the notation **Oil Recovery (F.P. >60°C)** are to satisfy the relevant requirements of *Pt 6, Ch 2 Electrical Engineering*.

5.2 Systems of supply and distribution

5.2.1 Only the systems of generation and distribution, listed under *Pt 6, Ch 2, 5.1 Systems of supply and distribution* 5.1.2, are acceptable.

5.3 Hazardous areas

5.3.1 Hazardous areas associated with oil recovery operations are classified into zones based upon the frequency of the occurrence and duration of an explosive gas atmosphere, as follows:

- **zone 0:** an area in which an explosive atmosphere is present continuously or for long periods or frequently
- **zone 1:** an area in which an explosive atmosphere is likely to occur periodically or occasionally in normal operation
- **zone 2:** an area in which an explosive atmosphere is not likely to occur in normal operation but, if it does occur, will persist for a short period only.

See IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*.

5.3.2 The following areas are regarded as hazardous, **zone 0**:

- (a) The interiors of tanks intended for the storage of recovered oil.
- (b) The interiors of piping systems intended for the handling of recovered oil.
- (c) The interiors of equipment containing or contaminated with recovered oil.
- (d) Unventilated spaces housing piping systems or other equipment containing or contaminated with recovered oil and having flanged joints or glands or other openings from which leakage of fluid may occur under normal operating conditions.

5.3.3 The following areas are regarded as hazardous, **zone 1**:

- (a) Unventilated spaces:
 - (i) separated by a single bulkhead, deck or other tank boundary from the interior of a tank intended for recovered oil, or
 - (ii) having a bulkhead immediately above or below and in line with a bulkhead of a tank intended for recovered oil, unless protected by a diagonal plate in accordance with *Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.9* or the arrangements comply with the requirements of *Pt 7, Ch 5, 3.1 Structural arrangement 3.1.7*.
- (b) Ventilated spaces housing piping systems or other equipment containing or contaminated with recovered oil and having flanged joints or glands or other openings from which leakage of fluid may occur under normal operating conditions.
- (c) Areas on open deck within a 3 m radius of:
 - (i) ventilation outlets of tanks intended for recovered oil; or
 - (ii) inspection hatches permitted to be opened under normal operating conditions of tanks intended for recovered oil; or
 - (iii) any sampling or sounding points of tanks intended for recovered oil; or
 - (iv) any flanged joints, glands or other parts of any equipment containing or contaminated with recovered oil from which leakage may occur under normal operating conditions; or

- (v) ventilation outlets from spaces described by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(a)* or *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(b)*.

Where the hazard results from flammable gas or vapour having a density relative to that of air of more than 0,75, the hazardous zone is considered to extend vertically downward to solid deck, or for a distance of 9 m, whichever is the lesser.

- (d) Areas on open deck within the confines of, and extending 3 m beyond, any bund or barrier intended to contain a spillage of recovered oil, up to a height of 2,4 m.
- (e) Areas on open deck within a 1,5 m radius of any opening into a space described by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(a)* or *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(b)*.
- (f) Enclosed or semi-enclosed spaces with direct opening into a **zone 1** hazardous area.

5.3.4 The following areas are regarded as hazardous, **zone 2**:

- (a) Ventilated spaces as defined by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(a)*.
- (b) Areas on open deck extending 1,5 m beyond those defined by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(c)* to *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3.(f)*.
- (c) Areas on open deck with unrestricted natural ventilation over all tanks intended for recovered oil, where the tops of the tanks are exposed to the weather, to the full width of the ship plus 3 m fore and aft of the forward-most and aft-most tank bulkhead, up to a height of 0,45 m above the deck or to the height of any bulwarks.
- (d) Enclosed or semi-enclosed spaces with direct opening into a **zone 2** hazardous area.

5.3.5 Vertical and horizontal extent of hazardous areas defined by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.3* and *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.4* is to be additionally considered with reference to density relative to air of flammable gas or vapour encountered. See IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*.

5.3.6 Consideration may also be given to hazardous areas and sources of hazard defined in accordance with IEC 60079: *10-1: Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres* and the following are to be submitted.

- (a) Design statement that defines the service profile of the oil recovery ship;
- (b) A concept of operation (ConOps) document, which is to include:
 - (i) a functional description of how the ship is intended to be operated; and
 - (ii) details of the ship's intended service, including the overall purpose(s), and the maximum duration of oil recovery operations per year;
- (c) Hazardous area classification data sheets, as required by IEC 60079-10-1: *Explosive atmospheres – Part 10-1: Classification of areas – Explosive gas atmospheres*;
- (d) Hazardous area plans, indicating the location of hazardous areas, and their openings, access and ventilation arrangements;
- (e) the hazardous areas classification study is to consider the operation of the oil recovery equipment in reasonably foreseeable normal and abnormal operations; and
- (f) Schedule of electrical and mechanical equipment to be located in hazardous areas.

5.4 Ventilation

5.4.1 The extent of any hazardous within an enclosed or semi-enclosed space may be limited to that defined for an equivalent situation on open deck, provided that the ventilation arrangements fulfill all the following conditions:

- (a) Mechanical ventilation is provided, with the air intake and outlet located outside any hazardous area defined by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.1*, ensuring at least 12 air changes per hour, and leaving no region of stagnant air.
- (b) Ventilation air flow is continuously monitored and so arranged that, in the event of failure of ventilation, an alarm is given at an attended station.

5.4.2 An enclosed or semi-enclosed space having a ventilation outlet situated in a hazardous area, as defined under *Pt 7, Ch 5, 5.3 Hazardous areas* or *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.4.(c)*, may be regarded as non-hazardous if fulfilling all the following conditions:

- (a) The space has mechanical ventilation with the air intake from a non-hazardous area.
- (b) The ventilation outlet is equipped with a self-closing flap or other suitable means of closure operating automatically on loss of ventilation airflow.

- (c) The space contains no equipment of a type described in *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.2*, or vent from or opening into any hazardous space or zone defined by *Pt 7, Ch 5, 5.3 Hazardous areas 5.3.1*, other than the ventilation outlet under consideration.
- (d) The space is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil.

5.5 Pressurisation

5.5.1 A space having access to a hazardous area defined as **zone 1** may be regarded as non-hazardous if all following requirements are met:

- (a) access is by means of an air-lock, having gastight steel doors, the inner of which, as a minimum, is self-closing without any hold-back arrangement;
- (b) it is maintained at an overpressure (minimum 0,25 mbar) relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given;
 - (ii) the electrical supply to all equipment not of a type suitable for **zone 1** is automatically disconnected;
 - (iii) where the disconnection of equipment could introduce a hazard, an alarm may be given, in lieu of automatic disconnection, upon loss of overpressure; and
 - (iv) a means of manual disconnection of electrical equipment not of a type suitable for **zone 1**, capable of being controlled from an attended station, is to be provided in conjunction with an agreed operational procedure; and
 - (v) where the means of disconnection, capable of being controlled from an attended station, is located within the space then it is to be of a type suitable for **zone 1**;
- (d) any electrical equipment required to operate upon loss of overpressure, lighting fittings and equipment within the air-lock, is to be of a type suitable for **zone 1**;
- (e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 1**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space; and
- (f) it is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil

5.5.2 A space having access to a hazardous area defined as **zone 2** may be regarded as non-hazardous if all following requirements are met:

- (a) access is by means of a self-closing gastight steel door without any hold-back arrangement;
- (b) it is maintained at an overpressure (minimum 0,25 mbar) relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given; and
 - (ii) a means of manual disconnection of electrical equipment not of a type suitable for **zone 2**, capable of being controlled from an attended station, is to be provided; where the means of disconnection, capable of being controlled from an attended station, is located within the space then it is to be of a type suitable for **zone 2**;
- (d) any electrical equipment required to operate upon loss of overpressure (e.g. lighting fittings), is to be of a type suitable for **zone 2**;
- (e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 2**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space; and
- (f) it is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil.

5.5.3 A space having access to a hazardous area defined as **zone 1** may be regarded as **zone 2** if all following requirements are met:

- (a) access is by means of a self-closing gastight steel door without any hold-back arrangement;
- (b) it is maintained at an overpressure relative to the external hazardous area by ventilation from a non-hazardous area;
- (c) the relative air pressure within the space is continuously monitored and so arranged that:
 - (i) in the event of loss of overpressure, an alarm is given; and
 - (ii) a means of manual disconnection of electrical equipment not of a type suitable for **zone 1**, capable of being operated from an attended station, is to be provided; where the means of disconnection, capable of being operated from an attended station, is located within the space then it is to be of a type suitable for **zone 1**;

- (d) any electrical equipment required to operate upon loss of overpressure (e.g. lighting fittings), is to be of a type suitable for **zone 1**; and
- (e) means are to be provided to prevent electrical equipment, other than of a type suitable for **zone 1**, being energised until the atmosphere within the space is made safe, by air changes of at least 10 times the capacity of the space.

5.6 Selection of electrical equipment for installation in hazardous areas

5.6.1 The installation of electrical equipment in hazardous areas is to be minimised.

5.6.2 When electrical equipment is to be installed in hazardous areas, it is to be of a type appropriate for Group IIA, temperature class T3 and compliant with the relevant Parts of IEC 60079: *Explosive atmospheres*, or an acceptable and relevant National Standard, unless permitted otherwise by Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas 5.6.4 Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas 5.6.5, or Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas 5.6.6.

5.6.3 Equipment for **zone 0** or **zone 1**, with the exception of simple apparatus as defined in Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas 5.6.4 or Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas 5.6.5, is to be certified or approved by a National or other appropriate authority. Equipment without independent certification or approval may be considered for installation in **zone 2**.

5.6.4 In **zone 0**, the following may be considered:

- (a) intrinsically safe, category 'a' (Ex 'ia');
- (b) simple electrical apparatus and components (for example thermocouples, photocells, strain gauges, junction boxes, switching devices), included in intrinsically safe circuits of category 'ia', compliant with IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*; and
- (c) submersible pumps, having at least two independent methods of shutting down automatically in the event of low liquid level.

Note Oil recovery equipment deployed over an oil spill pool is to be appropriate for **zone 0**.

5.6.5 In **zone 1**, the following may be considered:

- (a) apparatus permitted within **zone 0**;
- (b) intrinsically safe, category 'b' (Ex 'ib');
- (c) simple apparatus as defined above, included in intrinsically safe circuits of category 'ib';
- (d) increased safety (Ex 'e');
- (e) flameproof (Ex 'd');
- (f) pressurised enclosure (Ex 'p');
- (g) powder filled (Ex 'q'); or
- (h) encapsulated (Ex 'm').

5.6.6 In **zone 2**, the following may be considered:

- (a) apparatus permitted within **zone 1**;
- (b) type of protection 'n' or 'N';
- (c) equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2: *Explosive atmospheres – Part 2: Equipment protection by pressurized enclosures "p"*; or
- (d) radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15: *Explosive atmospheres – Part 15: Equipment protection by type of protection "n"*. Additionally, in the case of transmitter aerials, it is to be shown, by detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment.

5.6.7 Consideration may also be given to other types of protection, selected in accordance with the requirements of IEC 60079-14: *Explosive atmospheres – Part 14: Electrical installations design, selection and erection*.

5.6.8 Electrical equipment not essential for the safety or operation of the ship and which is not of a type providing protection against ignition of the recovered oil gases is to be completely disconnected and protected against unauthorised re-connection. Disconnection is to be made outside the hazardous areas and be effected with isolating links or lockable switches.

5.6.9 Electrical installations in machinery spaces adjacent to recovered oil tanks, where permitted by Pt 7, Ch 5, 3.1 Structural arrangement 3.1.7, are to be of a type described in Pt 7, Ch 5, 5.6 Selection of electrical equipment for installation in hazardous areas 5.6.6 within 0,45 m of the tank bulkhead or the bottom of the space.

■ Section 6

Fire protection and extinction

6.1 Structural fire protection

6.1.1 Where provision is made for heating of the collected oil, the requirements of *Pt 7, Ch 5, 6 Fire protection and extinction* are applicable for assignment of the notation **Oil Recovery (F.P. >60°C)**. Where there is no provision for heating the collected oil, the requirements of *Pt 7, Ch 5, 6 Fire protection and extinction* are not applicable for assignment of the notation **Oil Recovery (F.P. >60°C)** in this case the structural fire protection is to be installed as required by the applicable rules for a cargo ship.

6.1.2 Exterior boundaries of superstructures and deckhouses enclosing accommodation and service spaces, including any overhanging decks which support such accommodation and service spaces, are to be insulated to 'A-60' standard for all parts which face deck areas where there are arrangements for collection, handling and transfer of recovered oil and for a distance 3 m aft or forward thereof.

6.1.3 Windows and side scuttles in the exterior boundaries, referred to in *Pt 7, Ch 5, 6.1 Structural fire protection 6.1.2*, are to be provided with permanently installed inside covers of steel. Aluminium alloy components are not to be used in the construction of the windows and side scuttles.

6.1.4 As an alternative to compliance with *Pt 7, Ch 5, 6.1 Structural fire protection 6.1.2* and *Pt 7, Ch 5, 6.1 Structural fire protection 6.1.3*, a fixed water spraying system may be accepted. The system is to be capable of delivering water at a rate of 10 litres/m²/min. on all boundaries, windows and side scuttles, that would otherwise be required to comply with *Pt 7, Ch 5, 6.1 Structural fire protection 6.1.2* and *Pt 7, Ch 5, 6.1 Structural fire protection 6.1.3*.

6.2 Fire-extinguishing arrangements

6.2.1 Deck areas, where there are arrangements for the collection, handling and transfer of recovered oil, are to be provided with the following fire-extinguishing equipment:

- (a) Two dry powder fire-extinguishers, each at least 50 kg capacity.
- (b) At least one portable low expansion foam applicator.

6.2.2 The fire-extinguishers are to be located near the working deck identified in *Pt 7, Ch 5, 6.2 Fire-extinguishing arrangements 6.2.1* and are to be fitted with discharge hoses.

6.2.3 The foam installation is to be capable of applying foam to any part of the working deck. The capacity of any applicator is to be not less than 400 litres/min. of foam solution and the applicator throw in still air conditions is to be not less than 15 m. Sufficient foam concentrate is to be provided for at least 0,4 litres/m² of the working deck area with a minimum quantity of 200 litres.

6.3 Fireman's outfits

6.3.1 At least two firemen's outfits, additional to those required by *Pt 6, Ch 4, 2 Fire detection, protection and extinction* or SOLAS Reg II-2/C, 10 *Fire-fighter's outfits* as applicable, are to be provided.

■ Section 7

Operating Manual

7.1 General

7.1.1 Information regarding the safe use of the ship with respect to the oil recovery and subsequent operations is to be prepared.

7.1.2 The Operating Manual is, in general, to contain information regarding procedures for:

- (a) establishing and maintaining a safe atmosphere in any space(s) liable to become hazardous during oil recovery and subsequent operations;

- (b) isolation, where necessary, of electrical equipment in zones or spaces considered hazardous during oil recovery and subsequent operations, and in spaces described in *Pt 7, Ch 5, 7.1 General 7.1.2* prior to carrying out, or on failure of, the measures required to establish and maintain a safe atmosphere;
- (c) fire-fighting;
- (d) gas measurements;
- (e) recovery and storage of oil;
- (f) ballasting;
- (g) transfer of recovered oil;
- (h) tank cleaning;
- (i) gas freeing; and
- (j) contacts in the event of an emergency.

7.1.3 For assignment of the notation **Oil Recovery (F.P. >60°C)**, the operating manual is to provide information regarding procedures to monitor and record the flash point of the recovered oil. The procedures are to include guidance for stopping oil recovery operations if the flash point of the recovered oil is 60°C or lower.

Section

- 1 **General**
- 2 **Arrangements**
- 3 **Positioning, monitoring and control arrangements**
- 4 **Fire protection, detection and extinction**
- 5 **Piping systems**
- 6 **Trials and testing**

■ *Section 1* **General**

1.1 Application

1.1.1 The requirements of this Chapter apply to tankers equipped with bow/stern loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals, such as loading platforms, loading buoys, FPSOs and FSUs, and are additional to those applicable in other Parts of the Rules. These requirements also apply to submerged turret loading systems where applicable.

1.1.2 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.1.3 The materials used are to be suitable for the intended service conditions.

1.2 Class notations

1.2.1 Ships complying with the requirements of this Chapter will be eligible to have one of the following special features notations included in the class notation:

- (a) Ships fitted with a bow loading system, **BLS**.
- (b) Ships fitted with a stern loading system, **SLS**.
- (c) Ships fitted with submerged turret loading systems, **TLS**.

1.3 Surveys

1.3.1 The survey of these items is to be arranged to coincide with hull and machinery surveys, *see Pt 1, Ch 3 Periodical Survey Regulations*.

1.4 Submission of plans and documentation

1.4.1 In addition to the plans and information required by other relevant Sections of the Rules, the plans and information detailed below are to be submitted:

(a) Bow/stern loading:

Detail drawing(s) showing:

- Cargo loading equipment.
- Manifold position and pipeline connections.
- Mooring equipment layout, including design loads and supporting structure.
- Fire safety arrangements.
- Control station(s).

(b) Systems and arrangements:

General arrangement. Plans showing the general arrangement of all areas where the piping systems are located, together with ventilation arrangements and details of openings for any enclosed spaces at the fore and/or aft part of the ship.

Diagrammatic arrangement. Plans indicating all piping systems arrangements associated with loading systems between cargo tank area and manifold. The plans are to include details of means of isolation, manifold arrangement, means of draining, inerting, cleaning and gas freeing of the cargo piping. Also details of manifold drip tray arrangements with means of drainage, together with any stripping line arrangements, are to be submitted. If the ship is to be installed with a vapour emission control system, plans showing details of piping arrangements are also to be submitted.

Piping system specification. Piping design information which includes the materials specifications, design pressure, maximum allowable transfer rate, corrosion allowance, and design ambient weather conditions. Also the design forces and moments for which the presentation manifold, together with the terminal flange and associated supporting arrangements have been designed, are to be submitted.

Operating Manuals. Operating Manuals are to be submitted for approval and provided on board. The Manuals are to include the following information:

- Particulars of piping arrangements and control systems.
- Operating criteria.
- Procedures for connecting/disconnecting the cargo hose, isolation arrangements, inerting, cleaning, gas freeing of the pipe line and drainage of the drip tray.
- Procedures to be followed during cargo handling operations. These are to include guidance on procedures to be followed in the event of sudden closure of the terminal valve.
- Detailed communication sequence concerning pre-mooring, mooring, pre-loading, loading and tanker departure phases.

Where the ship is fitted with dynamic positioning and/or a positional mooring system(s), the information required by *Pt 7, Ch 4, 1.3 Information and plans required to be submitted 1.3.7* and *Pt 7, Ch 8, 1.5 Plans and data submission 1.5.6* is also to be submitted as applicable.

(c) **Submerged turret loading:**

Detail drawing(s) showing:

- Arrangement of turret room, including receiving structure, locking mechanism and traction winch equipment with associated supporting structure and design loadings.
- Turret hatch and operating equipment, including hydraulic power pack and control systems, and cargo loading equipment.
- Turret room fire safety arrangements.
- Turret room electrical installations.
- Piping arrangements for all systems associated with the turret loading.

■ Section 2 Arrangements

2.1 Mooring arrangements

2.1.1 The ship is to be provided with sufficient mooring arrangements, which may be combined with the ship's manoeuvring system, to ensure adequate alignment and security during bow, stern or submerged turret loading operations.

2.1.2 The mooring/positioning system is to be arranged to prevent mooring forces being transmitted to the loading line connector.

2.1.3 Suitable single point mooring arrangements are indicated in *Pt 3, Ch 13, 11 Mooring of ships at single point moorings*.

2.1.4 Particular attention is to be given to operational requirements and conditions in the design and mounting of securing devices and fittings. Seatings for equipment are to be designed to avoid the formation of pockets or recesses which may lead to excessive corrosion in service.

2.2 Materials for mooring fittings

2.2.1 Where mooring fittings are used as part of a positional mooring system, they are to comply with the requirements of *Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems*.

2.3 Strength of mooring fittings

2.3.1 The strength of the mooring arrangements associated with the bow/stern loading system is to be considered on the basis of *Pt 3, Ch 13, 11 Mooring of ships at single point moorings*, and *Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems* as applicable.

2.4 Enclosed spaces adjacent to manifold connection

2.4.1 In addition to the arrangements required by *Pt 7, Ch 6, 4 Fire protection, detection and extinction*, the following are to be complied with:

- (a) Spaces where an explosive gas atmosphere may be present are to be suitably ventilated prior to entry.
- (b) Spaces required to be entered during normal operations are to be provided with permanent ventilation arrangements capable of being operated from outside the compartment.

2.4.2 The ventilation arrangements are to provide a minimum of eight air changes per hour, see *Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts*.

■ Section 3

Positioning, monitoring and control arrangements

3.1 General

3.1.1 The requirements of this Section are additional to those given in *Pt 6, Ch 1 Control Engineering Systems*, and *Pt 7, Ch 4 Dynamic Positioning Systems* and *Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems*.

3.1.2 If the ship is fitted with a dynamic positioning system, it is at least to comply with the DP(AM) requirements, see *Pt 7, Ch 4 Dynamic Positioning Systems*.

3.2 Control station

3.2.1 A control station for offshore loading may be arranged within the bow area or on the navigation bridge. All operations concerning positioning of the ship and monitoring of mooring and loading parameters are to be capable of being performed from this station.

3.3 Instrumentation

3.3.1 Bow/stern mooring instrumentation is to monitor:

- (a) Mooring line traction.
- (b) Chain stopper.
- (c) Data logger system for recording of mooring and load parameters.

3.3.2 The mooring system is to be provided with a tension meter capable of continuously indicating the tension during the bow loading operation. Consideration may be given to waiving this requirement for ships fitted with a dynamic positioning system.

3.3.3 Bow/stern/submerged turret loading instrumentation is to be provided as follows:

- (a) Indicator for loading connector coupling position.
- (b) Cargo valve position indicators.
- (c) Cargo tank level indicators and high level alarm.
- (d) A system for automatic transfer of signals from the control and safety system, to enable personnel on the offshore terminal to effect control of cargo transfer pump(s) and closing of valve(s) on the terminal.

3.4 Emergency disconnect arrangements for pipeline and mooring

3.4.1 In addition to any automatic disconnection systems, a manually operated backup emergency disconnection system is to be provided. This system is to make possible individual operation of the chain stopper and coupling by-pass locks located in the bow control station.

3.4.2 Where an emergency quick-release system is fitted for the mooring system, an equivalent arrangement is to be provided to release the cargo loading hose outboard of the ship.

3.5 Communication

3.5.1 Main and emergency means of communication are to be provided between the bow control station and the offshore loading terminal. The communication equipment is to be intrinsically-safe.

3.5.2 Continuous communication is to be maintained between the control station and the offshore terminal at all times.

■ **Section 4** **Fire protection, detection and extinction**

4.1 General

4.1.1 The fire protection and extinction arrangements are to comply with the requirements of the *SOLAS - International Convention for the Safety of Life at Sea*, as amended, or as required by the National Authority.

4.1.2 When Lloyd's Register (hereinafter referred to as 'LR') is authorised to act on behalf of the National Authority in giving effect to the fire safety measures on non-convention tankers or the application of *SOLAS - International Convention for the Safety of Life at Sea* for convention ships, LR will also apply the *MSC/Circular.474 – Guidelines for Bow and Stern Loading and Unloading Arrangements on Oil Tankers – (Adopted on 9 May 1988)*, dated 19 June 1987.

4.1.3 Tankers of less than 500 gross tons will be specially considered.

■ **Section 5** **Piping systems**

5.1 Materials

5.1.1 All materials used in the piping systems are to be suitable for use with the intended cargoes and ambient weather conditions, and are to comply with the relevant requirements of *Pt 5, Ch 12 Piping Design Requirements* and the applicable requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021*.

5.2 Piping system design

5.2.1 All piping, valves and fittings are to be suitable for the design operating and environmental conditions.

5.2.2 The piping is to comply with the requirements for manufacture, testing and certification of Class II piping systems.

5.2.3 The pipelines and associated piping systems and equipment forward and/or aft of the cargo area are to have only full penetration butt welded joints, except at the loading station where valve connections may be flanged. The pipes are not to pass through enclosed spaces and are to be, as far as possible, self-draining.

5.2.4 Means of mechanical isolation are to be provided in the cargo area, where any pipes used for cargo handling are branched off from the cargo system. Such isolation is to be as near as possible to the boundary of the aftmost, in the case of stern loading, or forwardmost, in the case of bow loading, cargo tank bulkhead and within the cargo area.

5.2.5 A manually operated shut-off terminal valve is to be provided at the manifold. In addition, a blank flange, or equivalent arrangement, is to be provided at the bow and/or stern pipe line end connection.

5.2.6 The terminal pipe, valves and other fittings to which the cargo hose is directly connected are to be of steel or other approved ductile material. They are to be of robust construction, adequately supported and suitable for the stated design conditions. Attention is drawn to the *Recommendations for Oil Tanker Manifolds and Associated Equipment*, published by OCIMF.

5.2.7 Means of emptying, cleaning, inerting and gas-freeing the pipe lines used for cargo handling are to be provided. The venting arrangements are to be located in the cargo deck area. Isolation similar to that described in *Pt 7, Ch 6, 5.2 Piping system design 5.2.4* is also to be provided.

5.2.8 A drip tray of adequate size, together with means of drainage, are to be provided at the manifold. Suitable spray shields are to be fitted in way of the terminal manifolds where leakage may occur at valves and pipe joints.

5.2.9 Zones on open deck within 3 m of loading manifolds or pipe joints, and within 3 m of the spillage drip tray, are to be regarded as hazardous with regard to machinery or other equipment which could constitute a possible source of ignition, see also *Pt 6, Ch 2, 14.2 Hazardous areas* and *Pt 6, Ch 2, 14.10 Requirements for tankers intended for the carriage in bulk*.

5.2.10 Air vent pipes to the tanks and enclosed spaces, and mechanical ventilation outlets are to be located as far as possible, but in no case less than 3 m, from the terminal manifold or the nearest barrier of the spillage drip tray, whichever is closer.

5.3 Piping system testing and non-destructive examination

5.3.1 Testing and non-destructive examination of the piping system is to comply with the relevant requirements for Class II piping.

■ **Section 6** **Trials and testing**

6.1 General

6.1.1 The arrangements and equipment referred to in this Chapter are to be examined and tested on completion of the installation, including calibration of coupling equipment.

6.1.2 Examination and testing is to include witnessing of the initial hook-up trials and the implementation of operational procedures for the range of actions covered by the Operating Manual.

Section

- 1 **General**
- 2 **Coal storage, handling, ash collection and disposal arrangements**
- 3 **Coal burning equipment**
- 4 **Ship structure**
- 5 **Electrical equipment**
- 6 **Control engineering systems**
- 7 **Fire protection and extinction**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships using coal as a primary source of heat for the generation of steam for main and essential auxiliary services.

1.1.2 The relevant requirements of the Rules and those of the National Authority with whom the ship is registered, together with any special requirements of the Administration within whose territorial jurisdiction the ship is intended to operate, are to be complied with. Attention is drawn to the statutory requirements concerning intact and damaged stability of the ship.

1.1.3 For the purpose of these requirements, it is assumed that no manual handling of coal for the transportation from bunkers to boiler, or for actual firing of the boiler, will be employed. The emphasis has been placed on the presumption that the boiler firing will be by some form of moving grate. Special consideration will be given to other forms of firing, such as pulverised fuel, slurries of coal-oil-water mixtures or fluidised bed firing, if submitted.

1.1.4 For single main boiler installation, see *Pt 5, Ch 3, 5.3 Single main boiler*.

1.2 Submission of plans

1.2.1 The plans and information required by *Pt 7, Ch 7, 1.2 Submission of plans 1.2.2* to *Pt 7, Ch 7, 1.2 Submission of plans 1.2.4* are to be submitted in triplicate for consideration.

1.2.2 General arrangement plans and specification of the storing, handling and burning equipment and ash handling plant.

1.2.3 Structural plans showing details and arrangements in way of coal bunkers, and support arrangements for coal handling and ash disposal plants.

1.2.4 A general arrangement plan showing details of construction, fire protection and extinction for coal bunkers and coal handling systems, supplemented as necessary, by detailed plans and calculations for fire-extinguishing, explosion suppression, temperature monitoring and carbon monoxide detection systems.

1.3 Surveys

1.3.1 Coal bunkering, coal handling, burning and ash disposal plants are to be built, installed, and tested under operating conditions to the Surveyors' satisfaction and subsequently at each Boiler Survey. Fire-extinguishing, explosion suppression, temperature monitoring and carbon monoxide detection systems are to be installed and tested to the Surveyors' satisfaction and subsequently examined annually as required by *Pt 1, Ch 3, 2.2 Annual Surveys*.

1.4 Additional bilge drainage

1.4.1 It should be noted that, under the provision of *SOLAS - International Convention for the Safety of Life at Sea*, additional bilge drainage is required for passenger ships burning coal, as detailed in *Pt 7, Ch 7, 1.4 Additional bilge drainage 1.4.2* and *Pt 7, Ch 7, 1.4 Additional bilge drainage 1.4.3*.

1.4.2 In passenger ships there shall be provided in the boiler room, in addition to the other suctions required by the Rules, a flexible suction hose of suitable diameter and sufficient length capable of being connected to the suction side of an independent power pump.

1.4.3 In passenger ships where there is no watertight bulkhead between the engine and the boiler spaces, a direct discharge overboard or, alternatively, a by-pass shall be fitted from any circulating pump discharge used for emergency bilge pumping duties.

■ *Section 2*

Coal storage, handling, ash collection and disposal arrangements

2.1 Coal storage

2.1.1 The arrangements for coal bunkers, including hatchways, ventilation, monitoring and their design characteristics regarding intact and damaged stability are to comply with the requirements detailed in *Pt 7, Ch 7, 4 Ship structure* and *Pt 7, Ch 7, 7 Fire protection and extinction*, as applicable.

2.1.2 Coal is to be stored in not less than two bunkers. Vessels on restricted routes having a voyage time less than the capacity of the daily service hoppers, or where the boiler has the alternative means of firing, or where alternative means of propulsion are fitted, may be provided with only one bunker.

2.1.3 The clearance spaces between the boilers, other heated surfaces and the coal bunkers are to be adequate for the free circulation of air necessary to avoid transmission of heat to the coal.

2.1.4 A daily service storage hopper is to be provided for each coal-fired boiler.

2.1.5 Coal bunkers and daily service storage hoppers are to be designed to avoid dead spots and areas where coal can accumulate and impede the normal flow or can provide the conditions to promote spontaneous combustion.

2.1.6 Bunker and daily service storage hopper outlet gravity-fed discharges are to be provided with shut-off devices. Stopping the transfer device will be acceptable in lieu where a bunker delivers to transfer arrangements and stopping the transfer device effectively prevents flow from the bunker, *see Pt 7, Ch 7, 2.2 Coal handling 2.2.4*.

2.1.7 Shut-off devices on the coal bunker and daily service storage hopper outlets are to be capable of being operated locally and also from an accessible position outside the compartment in which they are situated.

2.1.8 The arrangements for loading coal into bunkers or during transfer into daily service storage hoppers should, in general, avoid the tendency of the coal to segregate. For this purpose multiple loading points should be used if necessary.

2.2 Coal handling

2.2.1 Each daily service storage hopper is to be provided with a separate system for transferring coal from the bunker(s). In the case of a single boiler installation, more than one transfer system from the bunker(s) to the daily service storage hopper are to be provided, unless alternative means of firing the boiler is available.

2.2.2 Adequate access facilities are to be provided in the coal feeder systems to permit maintenance and removal of blockages.

2.2.3 Where coal screens or crushers are necessary for the efficient operation of the coal burning equipment, they are to be provided in each boiler coal feed arrangement.

2.2.4 The coal handling plant is to be capable of being stopped locally and from an accessible position outside the compartment in which it is situated, *see Pt 7, Ch 7, 2.1 Coal storage 2.1.6*.

2.2.5 The use of milling systems for the production of pulverised fuel will be specially considered.

2.3 Ash collection and disposal arrangements

2.3.1 Each coal fired boiler is to be provided with a bottom ash and fly ash collecting and disposal arrangement.

2.3.2 Where both bottom ash and fly ash collecting and disposal arrangements are operated by either pneumatic or water systems, then these may be made common.

2.3.3 Two independent means of supplying the operating medium for ash collection and disposal systems are to be provided.

-
- 2.3.4 Heated ash storage and transfer systems are to be efficiently lagged to minimise risk of fire and to prevent damage by heat.
- 2.3.5 Where wet ash water transfer systems are used, consideration is to be given to the effects of corrosion and erosion on the collection, transfer and storage equipment.
- 2.3.6 Ash transfer systems employing water separation arrangements are to be such that water will drain naturally back to the de-watering bins or into a collection tank. Such drainage facilities should not, in general, be led direct to bilge wells.
- 2.3.7 Where a dry ash collection system is proposed, the arrangement of conveyors, pipes and chutes should avoid condensation due to excessive cooling to prevent solidification of the ash.
- 2.3.8 Adequate ash storage capacity, with access facilities to permit maintenance and removal of blockages, is to be provided for systems using boilers which have no alternative means of firing. Certain National Authorities or local Administrations prohibit the direct discharge of ash overboard.
-

■ *Section 3*

Coal burning equipment

3.1 Operating conditions

- 3.1.1 The design and arrangements for coal burning equipment are to be such that it can be manually controlled from a suitable position local to the boiler fronts.
- 3.1.2 Burning arrangements for solid fuel firing:
- (a) The arrangements should permit a sufficient level of control of coal feed to the grates or bed to avoid uneven firing conditions likely to cause damage to the grate or bed, due to excessive heat or coal build-up, under all operating conditions.
 - (b) In addition to the adequate supplies of air for efficient combustion, sufficient capacity and means of control of the combustion air supply below the grates or beds are to be provided to ensure cooling of the grate or bed under all conditions of coal or alternative means of firing.
 - (c) When the coal bed is not fully incandescent, i.e. during low steaming conditions when coal-fired beds are banked or reduced in output, sufficient purging sequences to sweep the furnace volumes are to be provided before any alternative means of firing is attempted.
- 3.1.3 Where it is proposed to provide means of firing the boiler simultaneously on coal and oil, details of the arrangements for furnace purging and ignition of oil burners are to be submitted and will be the subject of special consideration.

3.2 Forced and induced draught air fans

- 3.2.1 In boilers fitted with forced and induced draught fans, suitable bias is to be maintained to avoid gas leakage into the boiler room.
- 3.2.2 In the event of induced draught fan failure, the forced draught fan should be arranged to stop automatically. Alternative arrangements which will permit the forced draught fan to be controlled to reduce the supply of air may be considered.

3.3 Fuel characteristics and specification

- 3.3.1 In general, the coal burning equipment is to be designed to utilise the various grades of coal likely to be encountered.

3.4 Alternative means of firing

- 3.4.1 Where it is proposed to use an alternative means of firing, such as oil or coal/oil slurry mixtures, the arrangements are to be in accordance with the requirements for oil burning, *see Pt 5, Ch 14 Machinery Piping Systems*.
- 3.4.2 Particular attention is drawn to the requirements concerning arrangements for securely locking up-take dampers in the fully open position when burning fuel oil.
- 3.4.3 Where it is proposed to use fuel oil burners for lighting up coal fires, details are to be submitted of the pre-purging sequences of the boiler before lighting-up burners are introduced into the furnace.

3.4.4 Where it is proposed to employ lighting-up burners using diesel oil or similar marine distillate fuels, they are to be provided with their own combustion air supply.

3.4.5 Where it is proposed to use steam purging or steam atomising oil burners with coal fired boilers, particular attention is to be given to furnace purging arrangements. Details of the purging sequences are to be submitted.

3.4.6 The arrangements for purging the oil burners are to be such that the minimum practicable volume of oil will be introduced into the boiler furnace.

■ *Section 4* **Ship structure**

4.1 General

4.1.1 The requirements of this Section are additional to those given in other parts of these Rules and in separate Rules for specific ship types.

4.1.2 Other than as permitted in *Pt 7, Ch 7, 4.3 Coal bunker bulkheads 4.3.2*, separation between coal bunkers and adjacent spaces is to be gastight. In oil or chemical tankers, coal bunkers are to be separated from cargo tanks by means of cofferdams.

4.1.3 Boiler room access doors are to comply with *Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks*, as applicable.

4.1.4 Coaling ports on the side shell are to comply with parts of *Pt 3, Ch 11, 8 Side and stern doors and other shell openings* as applicable.

4.1.5 No side scuttles are to be fitted in spaces appropriated exclusively for the carriage of coal.

4.1.6 All openings from coal bunkers are to be located clear of the defined hazardous area for the particular ship type.

4.2 Coal bunker hatchways

4.2.1 Coal bunker hatchways are to be provided with gasketed steel covers and coamings, complying with *Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads*, as applicable.

4.2.2 Coal bunker hatchways are to be located clear of the defined hazardous area for the particular ship type.

4.3 Coal bunker bulkheads

4.3.1 The scantlings of main coal bunker boundary bulkheads which are counted towards the number of bulkheads required by *Pt 3, Ch 3, 4 Bulkhead requirements*, or which form the boundary of deep tanks, are to satisfy the requirements of *Pt 4, Ch 1, 9 Bulkheads*. Other boundaries are to satisfy the requirements of *Pt 4, Ch 1, 9 Bulkheads*, but the load head may be taken to the top of the bunker. The scantlings of cofferdam bulkheads not forming the boundaries of a cargo tank in oil or chemical tankers are to satisfy the requirements of *Pt 4, Ch 9, 7 Transverse oiltight bulkheads*. In all cases when flooding is envisaged as a means of fire-extinction, the moduli of stiffening members on bunker bulkhead boundaries are to be increased by 25 per cent.

4.3.2 Where the coal bunker is situated immediately forward of the engine room, the aft coal bunker bulkhead may be non-watertight. The scantlings for this bulkhead are to be as required for watertight bulkheads (*Pt 4, Ch 1, 9 Bulkheads*) but the load head may be taken to the top of the tank. With this arrangement, the forward end of the coal bunker may, if appropriate, be regarded as the engine room forward bulkhead.

4.3.3 The thickness of the plating in way of the bulkhead knuckles in the region of the hoppers and the plating of the hopper apexes is to be increased by 1.5 mm over that derived from *Pt 7, Ch 7, 4.3 Coal bunker bulkheads 4.3.1* and *Pt 7, Ch 7, 4.3 Coal bunker bulkheads 4.3.2*. However, the minimum thickness of the lowest strake in the coal hopper is to be not less than 9 mm. Where solid stainless steel is employed, the plate thickness may be reduced by 10 per cent or 1 mm, whichever is the lesser.

4.3.4 Non-watertight coal bunker bulkhead scantlings are to be as required by *Table 1.4.8 Non-watertight pillar bulkheads in Pt 4, Ch 1 General Cargo Ships*, but the thickness of the lowest strake is to be not less than 9 mm.

4.3.5 The scantlings of the boundaries of compartments intended for the storage of ash in liquid or slurry form will be specially considered.

4.3.6 Watertight doors may be fitted in watertight bulkheads between permanent and reserve bunkers, and may be of the sliding, hinged or equivalent type. They are to be accessible at all times, *see also Pt 3, Ch 11, 9 Watertight doors*.

4.3.7 Arrangements are to be made by means of screens or otherwise to prevent the coal from interfering with the closing of watertight doors.

4.4 Longitudinal strength

4.4.1 For the purpose of longitudinal strength, the requirements for the relevant ship types are to be applied.

4.4.2 The calculation of still-water shear forces and bending moments are to cover both departure and arrival conditions, and any special mid-voyage conditions caused by variation in coal bunkering and ballast distribution. Details of typical coal stowage rates are to be submitted, as well as trim and stability data for these conditions.

4.4.3 Where local reduction of double bottom depth is proposed to accommodate coal handling equipment, the strength of the double bottom and scarfing arrangements will require special consideration. Adequate scarfing of longitudinal material in way of double bottom and hopper tanks should be arranged.

4.5 Ventilation

4.5.1 Ventilators serving coal bunkers or boiler rooms are to comply with *Pt 3, Ch 12, 2 Ventilators* as applicable. In addition, the atmosphere in the bunkers is to be sampled by means of fixed or portable monitors as follows:

- (a) prior to entering the space – for oxygen deficiency,
- (b) prior to opening the hatchways – for accumulation of flammable gases.

4.5.2 Ventilator exits from main coal bunkers and coal processing spaces are to discharge clear of the defined hazardous area for the particular ship type and not less than 3 m from the nearest intake or opening to accommodation and enclosed working spaces, and from possible source of ignition.

■ **Section 5** **Electrical equipment**

5.1 General

5.1.1 All electrical equipment should be situated in positions where it is not exposed to concentration of coal dust. Where this is not practicable, the enclosure of the equipment should be designed and installed such that:

- (a) Dust cannot enter the interior of the enclosure. An ingress protection rating of at least I.P. 55 in accordance with IEC Publication 60529, if not of a safe-type, is considered to be acceptable.
- (b) Dust will not collect on the surface of the enclosure to such an extent that proper cooling is prevented, thus causing a dangerous rise in temperature.
- (c) The maximum surface temperature of the enclosure is not capable of igniting the dust, and should be limited to 165°C for equipment not subjected to overloading and 120°C for equipment such as motors, that may be overloaded.

5.2 Arrangements in coal bunkers

5.2.1 Electrical equipment located within the coal bunkers is to be of a safe-type certified for Group II A atmospheres and temperatures Class T1 in accordance with IEC Publication 60079, *Electrical Apparatus for Explosive Atmospheres*, or an equivalent National Standard.

5.2.2 The switches and protective devices for such equipment are to interrupt all lines or phases and are to be located outside the coal bunker spaces. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

■ Section 6 Control engineering systems

6.1 General

6.1.1 The requirements of *Pt 6, Ch 1 Control Engineering Systems* are applicable. The additional requirements for boilers which are coal grate-fired and under normal operation are remotely controlled or are automatic in operation, are given in *Table 7.6.1 Coal burning: Alarms and safeguards*.

6.1.2 In general, ships complying with the relevant requirements of *Pt 6, Ch 1, 4 Unattended machinery space(s) - UMS notation* or *Pt 6, Ch 1, 5 Machinery operated from a centralised control station - CCS notation* will be eligible for the notations **UMS** (unattended machinery space) or **CCS** (centralised control station) respectively.

Table 7.6.1 Coal burning: Alarms and safeguards

Item	Alarm	Note
Drum water level	Low	Combustion air; coal spreaders and/or any alternative fuel supply to be shut-off automatically
Daily service hopper level	High/Low	—
Coal feed plant	Failure	—
Primary combustion air system	Failure	Coal spreaders to be stopped automatically
Secondary combustion air system	Failure	—
Coal supply controller (if separate from spreader)	Failure	Per controller
Spreader drive	Failure/ Overload	Per drive. See also primary combustion air system failure
Grate drive	Failure/ Overload	Per drive
Localised overheating of the grate	Excessive	—
Induced draught fan	Failure	Coal spreaders to be stopped automatically, see also <i>Pt 7, Ch 7, 3.2 Forced and induced draught air fans 3.2.2</i>
Ash disposal system	Failure	—
Note Interlocks are to be provided to prevent the burning of fuel oil, unless dampers in the gas passages of uptakes have been securely locked in the fully-open position, see also <i>Pt 7, Ch 7, 3.4 Alternative means of firing 3.4.2</i> .		

■ *Section 7***Fire protection and extinction****7.1 Fire protection**

7.1.1 In general, the coal bunkers are to be separated from adjacent spaces by 'AO' divisions, but where such spaces are intended to contain highly flammable substances, such as the cargo tanks of an oil tanker, they are to be separated from the coal bunkers by a cofferdam or equivalent space.

7.1.2 The spaces above the coal in the coal bunkers and coal processing spaces are to be adequately ventilated to prevent the accumulation of flammable gases. The ventilators are to be provided with means of closure which are readily accessible at all times. Where mechanical ventilation is provided, means are to be provided for stopping the fans from a position which will be readily accessible at all times.

7.2 Fire-extinction

7.2.1 A fixed fire-extinguishing system should be provided in the coal bunkers. This system should discharge CO₂, but alternative arrangements such as water flooding will be considered, *see also Pt 7, Ch 7, 4.3 Coal bunker bulkheads*.

7.2.2 Where, due to operating conditions, it is considered likely that coal dust in significant quantities will be present in the coal crushing and conveying system, an explosion suppression system is to be provided in the coal crushing and conveying system. Activation of the explosion suppression system is to operate an audible and visual alarm.

7.2.3 A fixed fire-extinguishing system should be provided in the ready-use coal hopper and this should be extended to the boiler room, if there is any danger of the spread of fire to that space. The system should depend on CO₂, but alternative extinguishing media will be considered. Where it can be shown that the residence time, of the coal in the hopper, is of sufficiently short duration that a fire in the hopper is unlikely to be sustained, consideration will be given to dispensing with this requirement.

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to Lloyd's Register (hereinafter referred to as 'LR') classed ships with positional mooring systems or thruster-assisted positional mooring systems and are additional to those applicable in other Parts of the Rules. The Rules are not intended to apply to vessels which have station-keeping capabilities, but which are not required to remain on station in adverse weather conditions. This normally precludes the Rules being applicable to small ships.

1.1.2 Compliance with this Chapter is not mandatory, but ships provided with a positional mooring system or thruster-assisted positional mooring system which do comply will be eligible for an appropriate class notation which will be recorded in the *Register Book* at the specific request of an Owner.

1.1.3 The mooring system will be considered for classification with LR on the basis of operating constraints and procedures specified by the Owner and recorded in the Operations Manual.

1.1.4 Requirements, additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the administration within whose territorial jurisdiction it is intended to operate.

1.2 Classification notations

1.2.1 Ships provided with a positional mooring system which complies with the requirements of this Chapter will be eligible to have included in the class notation one of the following special features notations:

- (a) For ships fitted with a positional mooring system:

PM (Positional mooring system); or

PMC (Positional mooring system for mooring in close proximity to other ships or installations. This notation will apply in particular to any ship operating in conjunction with a fixed installation, e.g. crane barge, accommodation unit, maintenance vessel, etc.)

- (b) For ships fitted with a thruster-assisted positional mooring system:

PM [T1circ] [or [T2circ] or [T3circ]]

or

PMC [T1circ] [or [T2circ] or [T3circ]]

The numeral in the circled supplementary notation, [T1circ], etc. defines the thruster allowance which may be permitted in the design of the positional mooring system, and is determined by the capacity/redundancy of the thrust/machinery installation, see *Table 8.3.2 Thruster allowance*.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 1

1.2.2 Additional descriptive notes may be given and entered in column 6 of the *Register Book* indicating the type of positional mooring system, reference system, control system, limiting environmental criteria, etc.

1.2.3 Ships provided with a nearshore positional mooring system which complies with the requirements of *Pt 3, Ch 10, 16 Long-term nearshore positional mooring system* of the *Rules and Regulations for the Classification of Offshore Units, July 2021* will be eligible for the assignment of special features class notation **LTMOOR** (Long-term Terminal Mooring). This notation applies to a nearshore 'dry mooring system' to jetty or quay but not a 'wet mooring system' anchored to the sea bed. Strength and fatigue assessments are to be carried out in accordance with the *ShipRight procedure for Long-Term Nearshore Positional Mooring Systems*.

1.3 Surveys

1.3.1 The positional mooring and thruster-assisted positional mooring systems and their associated equipment are to be examined and tested during construction and under working conditions on completion of the installation. The Periodical Survey of these items is to be arranged to coincide with Hull and Machinery Surveys as required by other Parts of these Rules.

1.4 Definitions

1.4.1 Positional mooring is a method of station keeping by means of multiple anchor lines laid out in catenary array. Each positional mooring system is to consist of the following:

- (a) Anchors or anchor piles.
- (b) Anchor lines.
- (c) Anchor line fittings (shackles, connecting links, wire rope terminations, quick release devices, etc.).
- (d) Fairleads.
- (e) Winches or windlasses.
- (f) Chain or wire rope stoppers.

Where applicable, the structural or mechanical connection of these items to the ship is also considered to be part of the positional mooring system.

1.4.2 'Thruster-assisted Mooring' is the use of thrusters and main propulsion, if so designed, to supplement the ship's anchoring system.

1.5 Plans and data submission

1.5.1 The information and plans specified in *Pt 7, Ch 8, 1.5 Plans and data submission 1.5.2* to *Pt 7, Ch 8, 1.5 Plans and data submission 1.5.5* are to be submitted in triplicate. One copy of the Operations Manual referred to in *Pt 7, Ch 8, 1.5 Plans and data submission 1.5.6* is to be forwarded for information.

1.5.2 Plans and data dealing with positional mooring arrangements and the associated equipment are to be submitted, including the following:

- (a) Mooring arrangements with details of mooring patterns, anchor lines and fittings, etc.
- (b) Mooring equipment with details of anchors, fairleads and cable stoppers.
- (c) Winches or windlasses with details of gearing shafting, brake systems, ratchet and pawl, drum/cable lifter and frame.

1.5.3 For thruster-assisted positional mooring systems, plans of the following, together with particulars of ratings, in accordance with the relevant Parts of these Rules are to be submitted for the following:

- (a) Prime movers, gearing, shafting, propellers and thrust units, *see also Pt 5, Ch 8 Shaft Vibration and Alignment*.
- (b) Machinery piping systems.
- (c) Electrical installations.

In addition, details of proposals for the redundancy provided in machinery, electrical installations and control systems are to be submitted. These proposals are to take account of the possible loss of performance capability should a component fail. Where a common power source is utilised for thrusters, details of the total maximum load required for thruster-assist are to be submitted.

1.5.4 Plans of control, alarm and safety systems, including the following, are to be submitted:

- (a) Functional block diagrams of the control system(s).
- (b) Functional block diagrams of the position reference systems and the environmental sensors.
- (c) Details of the electrical supply to the control system(s), the position reference system(s) and the environmental sensors.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 2

- (d) Details of the monitoring functions of the controllers, sensors and reference system, together with a description of the monitoring functions.
- (e) List of equipment with identification of the manufacturer, type and model.
- (f) Details of the overall alarm system linking the centralised control station, subsidiary control stations, relevant machinery spaces and operating areas.
- (g) Details of the control stations, e.g. control panels and consoles, including the location of the control stations.
- (h) Test schedules which are to include the methods of testing and the test facilities provided.

1.5.5 The following supporting plans, data, calculations or documents are to be submitted:

- (a) General arrangement showing plan views, side elevations and sections of the ship.
- (b) Design criteria showing operating and survival environment, water depth range and required station keeping limits.
- (c) Environmental forces on ship showing wind, current and wave drift. These forces are to be verified by direct calculation, model test reports, or full-scale data, etc.
- (d) Ship motions showing first order wave motions, surge, sway and yaw. Tank test data or equivalent to be provided.
- (e) Mooring analysis, including computer printout where relevant.
- (f) Strength calculations for anchors, fairleads, winches/ windlasses, cable stoppers and special fittings.
- (g) Thruster arrangements for thruster-assist systems, including powers, thrusts and interactions between thrusters, thruster and hull, thruster and current.

1.5.6 An Operations Manual for the system is to be placed on board the ship. This Manual is to contain all necessary information and instructions regarding positional mooring and, where relevant, thruster-assisted positional mooring. It would normally also contain descriptions of the following:

- Mooring systems.
- Laying the mooring system.
- Anchor pre-loading.
- Pre-tensioning anchor lines.
- Tension adjustment.
- Winch performance.
- Winch operation.
- Procedure in event of failure or emergency.
- Procedure for operating thrusters.
- Fault-finding procedures for thruster-assist system.

■ Section 2

Environmental criteria - Forces and motions

2.1 Limiting environmental criteria

2.1.1 Limiting criteria in the form of maximum operating and survival environmental conditions are to be specified by the Owner or Designer.

2.1.2 The limiting criteria are to be defined in terms of wind and current speeds, wave heights and periods, and water depth range.

2.1.3 As water depth will have a large influence on a ship's mooring capability, the limiting environmental criteria may be varied according to water depth.

2.1.4 **Maximum operating conditions** will be those in which the ship is able to carry out its primary operational activities, while anchor line tensions remain within designated operating limits. See Pt 7, Ch 8, 3.2 *Design cases and factors of safety* for required factors of safety in operating conditions.

2.1.5 **Survival conditions** are to be based on an average recurrence period of not less than 50 years. The mooring system is to be such that maximum line tensions will be limited in these conditions to designated survival levels. See Pt 7, Ch 8, 3.2 *Design cases and factors of safety* for required factors of safety.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 3

2.2 Design environmental criteria

2.2.1 **Wind.** The design wind speed for wind force determination can normally be taken as the one-hour mean value referenced to 10 m above sea level. Account is to be taken of the variation of wind speed with height above sea level. The wind velocity gradient can be calculated from the following:

$$V_H = V_{10} \left(\frac{H}{10} \right)^{0,125}$$

where

V_H = wind velocity at H height above sea level

V_{10} = 1 hour mean wind speed referenced to 10 m above sea level.

2.2.2 **Current.** The design current speed is to be taken as the sum of wind-induced and tidal current velocities. For calculation purposes, tidal current velocity can be assumed constant over water depth, and wind-induced current velocity can be taken to reduce linearly from its maximum value at the surface to zero at 50 m below sea level.

2.2.3 **Wave.** The significant wave height and period range is to be defined for each relevant design case.

2.3 Environmental forces

2.3.1 In determining environmental forces, it is to be assumed that the defined limiting environment of wind, waves and current will act concurrently. For fixed azimuth mooring systems, these forces are considered to act in the same direction.

2.3.2 Environmental loading on the ship (and the corresponding catenary system motions analysis to determine anchor loads and line tensions, etc.) will require to be investigated for a sufficient number of directions to establish the critical cases.

2.3.3 It is generally to be assumed that the maximum specified environmental conditions can come from any direction relative to the ship's heading. However, in cases where a ship is to be restricted to specific defined locations, consideration will be given to the acceptance of an environmental rosette (allowing the ship to be headed in the most favourable direction with respect to mooring loads).

2.3.4 Where quasi-static methods of analysis are adopted (see Pt 7, Ch 8, 3.1 General 3.1.2), at least the wind, current, and mean wave drift forces acting on the ship in the various relevant design conditions are to be calculated or determined. In addition, any significant yawing moments induced by these effects are to be taken into account when carrying out the mooring system motions analysis.

2.3.5 Environmental forces and moments can be determined by suitable methods of direct calculation or by model testing. In either case, account must be taken of all significant load generating structural elements or equipment. In the case of wind force and moment determination, all deck structures, fittings, cranes, towers, superstructures, etc. are to be considered, and for current force, account is to be taken of thrusters, nozzles, propellers, etc.

2.3.6 First order wave motions – the oscillatory motions of the ship – are to be determined. Surge and sway are the most relevant motions in terms of quasi-static mooring analysis, see Pt 7, Ch 8, 3.1 General 3.1.2 and Figure 8.3.1 *Quasi-static analysis*.

2.3.7 The first order wave motions of the ship are to be determined from appropriate wave spectra, either by use of tank testing or by suitable direct calculation methods.

2.3.8 Account is to be taken of the effects of shallow water on the ship's first order wave motions.

■ Section 3

Mooring system - design and analysis

3.1 General

3.1.1 The positional mooring system is to be designed to meet the specified limiting environmental criteria (see Pt 7, Ch 8, 2.1 *Limiting environmental criteria*), and any associated operational constraints (restricted offset of ship, etc.) as contained in the Operations Manual.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 3

3.1.2 This Section in general, and the anchor line factors of safety in particular, relate principally to the quasi-static approach to mooring analysis. This method of analysis takes wind, current and wave drift forces to be steady effects which will displace the moored ship from its original equilibrium position to a new mean position where the mooring system will have developed sufficient restoring force to 'balance' the steady applied force. Wave-induced oscillatory vessel motions take place about this new mean position. In quasi-static analysis, maximum anchor line tensions are taken to occur at the extremity of vessel offset, *see also Figure 8.3.1 Quasi-static analysis*.

3.1.3 Consideration will be given to the adoption of alternative methods of design for the mooring system, including the use of part-dynamic or full-dynamic analysis techniques. In such cases, factors of safety, etc. will be specially considered.

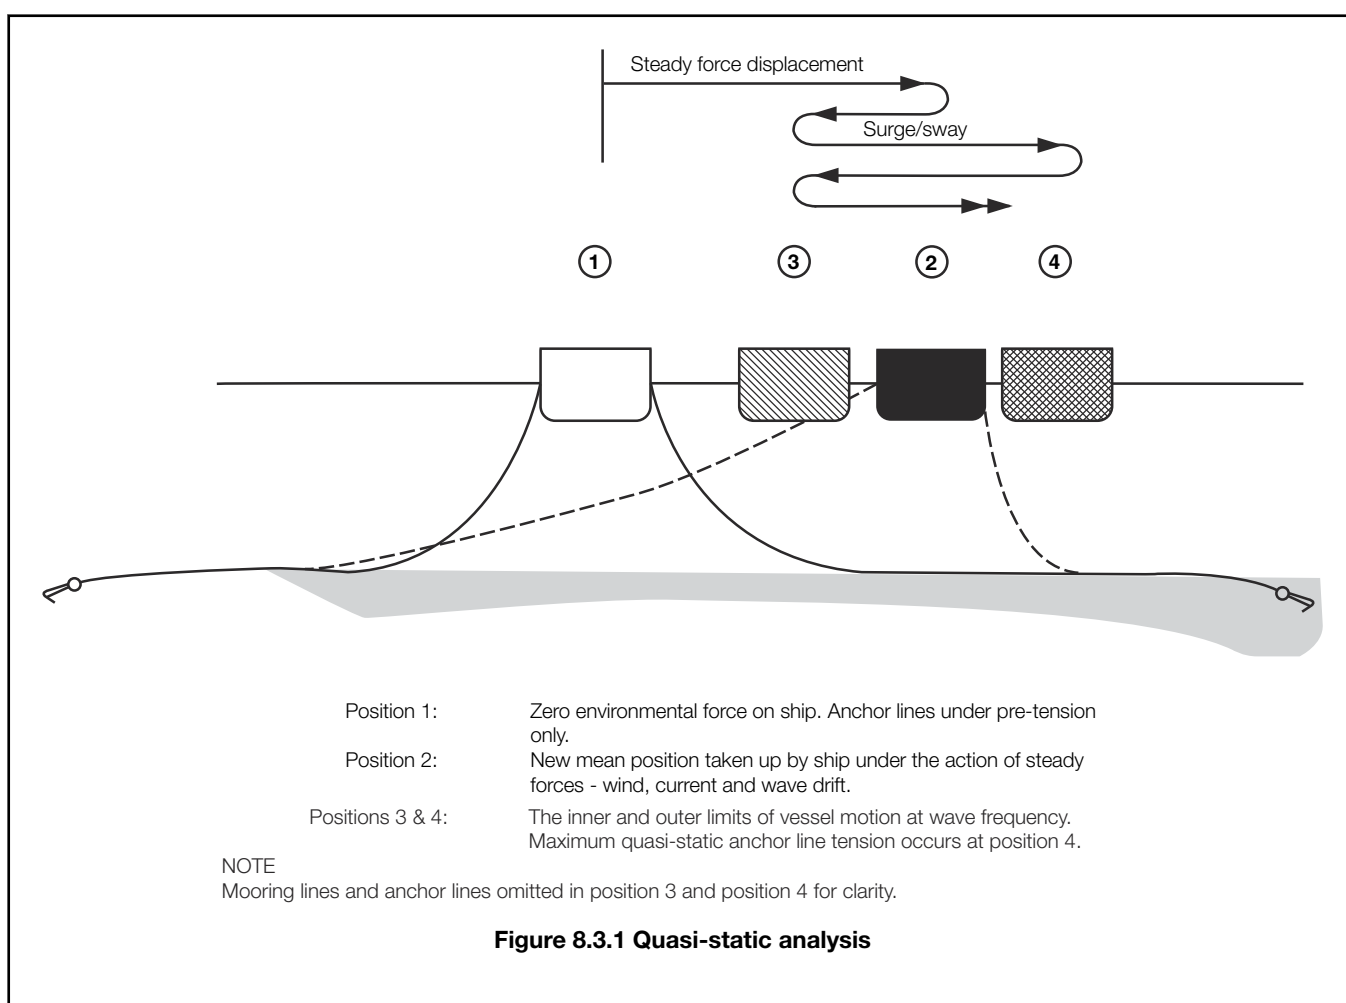

3.1.4 For ships which intend to utilise thruster assistance, as an aid to position-keeping or as a means of reducing anchor line tensions, the extent of thruster allowance which is permitted in calculations is given in *Table 8.3.2 Thruster allowance*.

3.1.5 Anchor line length is to be sufficient to avoid uplift forces occurring at the anchors in the worst damaged survival condition.

3.1.6 Account is to be taken in the mooring analysis of the elastic stretch of anchor lines.

3.2 Design cases and factors of safety

3.2.1 The design cases which require to be considered, and the associated minimum anchor line factors of safety are given in *Table 8.3.1 Minimum anchor line factors of safety*.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 3

Table 8.3.1 Minimum anchor line factors of safety

Design Case	Description	Factor of safety	
		Class notation	
		PM, PM(T1) etc.	PMC, PMC (T1)
1	Operating – Intact The ship in an operating mode with its mooring system intact, subject to specified operating constraints (limiting environment and permissible offset of the ship).	2,7	3,0
2	Survival – Intact The ship in survival mode with mooring system intact, subject to maximum (survival) environmental conditions.	1,8	2,0
3	Operating – Damaged As Case 1, but with loss of restraint of any one anchor line, <i>see also</i> Note 3.	1,8	2,0
4	Survival – Damaged As Case 2, but with loss restraint of any one anchor line.	1,25	2,0/1,4 (See Note 5)

Note 1. In the context of this Chapter, Cases 1 and 2 ('Intact' Cases) refer to the mooring system with all anchor lines intact. Cases 3 and 4 ('Damaged' Cases) refer to the mooring system with the loss of any one anchor line.

Note 2. Anchor line factor of safety = $\frac{\text{Minimum rated break strength}}{\text{Maximum line tension}}$

Note 3. The factors of safety given in *Table 8.3.1 Minimum anchor line factors of safety* are to be based on maximum line tensions resulting from steady force offset of the ship, plus maximum first order wave motion. In Design Cases 3 and 4, the factors relate to the ship in its post-damage settled position, following the loss of restraint from an anchor line, (i.e. neglecting transient effects, but see Note 4).

Note 4. In addition to the 'static' considerations in Design Cases 3 and 4 (see Note 3), account is also to be taken of transient vessel motions following anchor or line failure. The motion path taken by the vessel in moving to a new static equilibrium position is to be determined for each line breakage case to ensure that:

- (a) The ship maintains adequate clearance from any adjacent installation (applicable where **PMC** or **PMC (T1)** etc. notation is to be assigned). A minimum dimensional clearance of 10 m will normally be required.
- (b) The ship remains within its required operational excursion limits.
- (c) Successive line failures will not occur. In calculating factors of safety, the maximum anchor line tensions in this case are to be those resulting from the extreme point of transient motion, with the ship subject to steady force and significant wave motion.

Note 5. The factor of safety of 2,0 applies to critical lines maintaining separation between the moored ship and an adjacent installation.

Table 8.3.2 Thruster allowance

Case	Thruster allowance		
	(T1)	(T2)	(T3)
Operating (Intact)	None	70% of all thrusters, less one	All thrusters, less one
Survival (Intact)	70% of all thrusters	All thrusters	All thrusters
Operating (Damaged)	None	70% of all thrusters, less one	All thrusters, less one

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 4

Survival (Damaged)	70% of all thrusters	All thrusters	All thrusters
<p>Note 1. The conditions for assignment of supplementary notations , (T1), (T2) and (T3) are defined in <i>Pt 7, Ch 8, 8 Thruster-assisted mooring - Classification notation requirements</i>.</p> <p>Note 2. Where all thrusters are permitted, the net effect of all thrusters can be included in calculations.</p> <p>Note 3. Where all thrusters except one are permitted, the net effect of all thrusters, less the single most effective one, can be included in calculations.</p>			

■ Section 4 Mooring equipment

4.1 Anchors

4.1.1 Anchors for positional mooring are to be sufficient in number and holding power, and are to have adequate structural strength, for the intended service. It is the Owners'/ Operators' responsibility to ensure adequate anchor holding power for each location or holding ground.

4.1.2 The anchors are to be of an approved type. Supporting calculations to verify the structural strength of the anchor under proof test loading are to be submitted.

4.1.3 The anchors are to be manufactured in accordance with the requirements of *Ch 10 Equipment for Mooring and Anchoring* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021* (hereinafter referred to as the Rules for Materials).

4.1.4 The anchors are to be proof tested in the manner laid down in *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials. The level of proof test loading for positional mooring anchors is to be the greater of the following:

- (a) 50 per cent of the minimum rated break strength of the intended anchor line; or
- (b) the value given in *Table 10.1.1 Proof load tests for anchors (see Notes 1 and 2)* in *Rules for the Manufacture, Testing and Certification of Materials, July 2021* of the Rules for Materials.

4.2 Fairleads

4.2.1 Fairleads are to be designed to permit free movement of the anchor line in all mooring configurations. *Figure 8.4.1 Minimum operating range and design loading of fairlead* shows the minimum operating range of the fairlead to be considered in conjunction with the design load.

4.2.2 Fairleads and their supporting structures are to be designed for a load equivalent to the rated minimum break strength of the anchor line.

4.2.3 Maximum allowable stresses for the design criteria given in *Pt 7, Ch 8, 4.2 Fairleads 4.2.1* and *Pt 7, Ch 8, 4.2 Fairleads 4.2.2* are to be based on the following factors of safety:

Shear	1,89	Factors relate to tensile yield stress
Tension, compression or bending	1,25	Factors relate to tensile yield stress
Combined	1,11	Factors relate to tensile yield stress

$$(\text{combined stress} = \sqrt{\sigma_X^2 + \sigma_Y^2 - \sigma_X \sigma_Y + 3 \tau^2})$$

Where σ_X and σ_Y are the combined axial and bending stresses in the X and Y directions respectively and τ is the combined shear stress due to torsion and/or bending in the X-Y plane.

4.2.4 Materials and steel grades are generally to comply with the requirements given in *Pt 7, Ch 8, 5.2 Materials* for Type P components.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 4

4.2.5 Chain cable fairleads are to have a minimum of five pockets.

4.2.6 Wire rope fairleads are generally to have a minimum diameter of 20 times the wire rope diameter.

Figure 8.4.1 Minimum operating range and design loading of fairlead

4.3 Stoppers

4.3.1 Stoppers may require to be provided depending on the winch arrangements, see *Pt 7, Ch 8, 5 Anchor winches and windlasses*.

4.3.2 Where stoppers are fitted, they are to comply with *Pt 7, Ch 8, 5 Anchor winches and windlasses* in respect to mechanical and strength aspects, and *Pt 7, Ch 8, 6 Electrical and control equipment* for release arrangements.

4.4 Anchor lines

4.4.1 Anchor lines are generally to be of stud link chain cable, steel wire rope or a combination of both. Special consideration will be given to proposals for the use of alternative materials.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 5

4.4.2 Stud link chain cable is to be either of unified grade (U2 or U3) meeting the requirements of *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials, or an approved special grade.

4.4.3 Wire rope for anchor lines is to have a suitable construction for its purpose (6 x 37 construction with independent wire rope core is generally acceptable).

4.4.4 Steel wire ropes are generally to comply with *Ch 10, 5 Short link chain cables* of the Rules for Materials, or with an equivalent recognised National or International Standard.

4.4.5 Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.

■ Section 5 Anchor winches and windlasses

5.1 General

5.1.1 Machinery items are to be constructed, installed and tested in accordance with the relevant requirements of *Pt 5 Main and Auxiliary Machinery*. For electrical and control equipment, see *Pt 7, Ch 8, 6 Electrical and control equipment*.

5.2 Materials

5.2.1 Materials are generally to comply with the requirements of *Pt 5, Ch 1, 2.2 Materials*.

5.2.2 Components have been categorised in this Section as Type P (Primary) and Type S (Secondary) for material selection purposes.

(a) **Type P:** Components where failure would result in the loss of a primary function of the winch or windlass, e.g.:

Winch drum.

Windlass cable lifter.

Reduction gears.

Shafts.

Brakes.

Pawl stoppers.

Bedplates.

NOTE

Consideration will be given to designating any of the above components as Type S (see below), provided adequate redundancy of operation exists.

(b) **Type S:** Secondary, stressed items, not categorised as Type P, and where failure would not result in the loss of a primary winch function.

5.2.3 Steel materials for Type P or Type S components are generally to comply with the following Chapters and Sections of the Rules for Materials:

(a) Plates and bars: *Ch 3 Rolled Steel Plates, Strip, Sections and Bars Ch 3, 1 General requirements* and *Ch 3, 2 Normal strength steels for ship and other structural applications*, *Ch 3, 3 Higher strength steels for ship and other structural applications* or *Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service*, as appropriate.

(b) Castings: *Ch 4, 1 General requirements* and *Ch 4, 7 Ferritic steel castings for low temperature service*.

(c) Forgings: *Ch 5, 1 General requirements* and *Ch 5, 8 Ferritic steel forgings for low temperature service*.

Consideration will be given to the acceptance of suitable equivalent National Standards.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 5

5.2.4 Material grades are to be selected to provide the necessary notch toughness. See *Table 8.5.1 Material grades* for suitable Grades.

5.2.5 The requirements of *Pt 7, Ch 8, 5.2 Materials 5.2.3* and *Pt 7, Ch 8, 5.2 Materials 5.2.4* apply where the minimum design air temperature is within the range 0°C to minus 15°C. Requirements for design temperatures outside this range will be subject to special consideration.

5.2.6 For components such as gears, shafts and boltings made from rolled or forged bar materials not subject to welding, the material composition and heat treatment, etc. may be submitted for approval as an alternative to the requirements of *Table 8.5.1 Material grades*.

5.2.7 Non-ductile materials are not to be used for torque transmitting items or for those elements subject to tensile/bending stresses.

5.2.8 Spheroid graphite iron castings are to comply with *Ch 7, 3 Spheroidal or nodular graphite iron castings* of the Rules for Materials, Grades 370/17 or 400/12, or to an equivalent National Standard.

5.2.9 The use of grey iron castings will be subject to special consideration. Where approved, they are to comply with the requirements of *Ch 7, 2 Grey iron castings* of the Rules for Materials. This material is not to be used for gear components.

5.2.10 Brake lining materials are to be compatible with operating environmental conditions.

5.3 Brakes

5.3.1 Each anchor winch or windlass is required to have one primary braking system and one secondary braking system. The two systems are to operate independently.

5.3.2 The braking action of the motor unit may be used for secondary braking purposes where the design is suitable.

5.3.3 A residual braking force of at least 50 per cent of the maximum braking force required by *Pt 7, Ch 8, 5.5 Winch/Windlass performance 5.5.1* is to be immediately available and automatically applied in the event of a power failure.

5.4 Stoppers

5.4.1 If the winch motor is to be used as a secondary brake, then a stopper is to be provided to take the anchor line load during maintenance of the primary brake.

5.4.2 The stopper may be one of two different types – a pawl stopper fitted at the cable lifter/drum shaft, or a stopper acting directly on the anchor line.

5.4.3 Where the stopper acts directly on the cable, its design is to be such that the cable will not be damaged by the stopper at a load equivalent to the rated breaking strength of the cable.

5.4.4 See also *Pt 7, Ch 8, 6.2 Control stations 6.2.1* and *Pt 7, Ch 8, 6.2 Control stations 6.2.2* for stopper control station requirements, and *Pt 7, Ch 8, 6.4 Controls 6.4.5* for emergency release of stoppers.

Table 8.5.1 Material grades

	$80 < t \leq 100$	E, EH32, EH36					
	$100 < t \leq 130$	LT60 (See Note 3)					
	$130 < t \leq 160$	LT60					

Note 1. AW. Without post-weld heat treatment.

Note 2. PWHT. With post-weld heat treatment or not welded.

Note 3. Impact test temperature may be raised to –50°C.

Note 4. Use either $\frac{1}{2}$ Ni or $1\frac{1}{2}$ Ni with impact test at –70°C.

Note 5. Impact test temperature may be raised to –30°C.

Note 6. If PWHT is used, grades will be specially considered.

Note 7. To be specially considered.

5.5 Winch/Windlass performance

5.5.1 The primary brake is required to hold a static load equal to the minimum break strength of the anchor line (at the intended outer working layer of wire rope on storage drum winches). The static load capacity of the primary brake can be reduced to 80 per cent of that value when a stopper capable of holding 100 per cent of the breaking strength of the line is fitted.

5.5.2 The secondary brake is required to hold a static load equal to 50 per cent of the minimum breaking strength of the anchor line.

5.5.3 The anchor winch or windlass is to have adequate dynamic braking capability. The two brake systems in joint operation are to be capable of fully controlling, without overheating, the anchor lines during:

- (a) all anchor handling operations;
- (b) adjustment of anchor line tensions. (This is particularly relevant where the mooring system has been designed and sized, on the basis of active adjustment of anchor lines in extreme conditions, to minimise line tensions).

5.5.4 See also Pt 7, Ch 8, 6.2 Control stations for control of winches, windlasses, stoppers and pawls, and Pt 7, Ch 8, 6.4 Controls for brake fail safe requirements and standby power for operation of brakes and release of stoppers in the event of a failure of normal power supply.

5.5.5 The pulling force of the winches or windlasses is to be sufficient to carry out anchor pre-loading on location, to the necessary level. A minimum low-speed pull equal to 40 per cent of the anchor line breaking strength is recommended.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 5

5.6 Strength

5.6.1 Design load cases for the winch or windlass assembly and the stopper when fitted are given in *Table 8.5.2 Design load cases*. The associated maximum allowable stresses are to be based on the factors of safety given in *Table 8.5.3 Safety factors for design load cases*.

Table 8.5.2 Design load cases

Load case	Condition	Anchor line load percentage of break strength
1	Winch braked	100% (See Note)
2	Stopper engaged	100%
3	Winch pulling	40% or specified duty pull if greater

Note Where stopper is fitted, anchor line load in Case 1 can be taken as brake slipping load, but is not to be less than 80 per cent break strength

Table 8.5.3 Safety factors for design load cases

Stress	Load case	
	1 & 2	3
	Factor of safety	
Shear	1,89	2,5
Tension, compression, bending	1,25	1,67
Combined	1,11	1,43

Note 1. Factors of safety relate to tensile yield stress.

Note 2. Combined stress = $\sqrt{\sigma_X^2 + \sigma_Y^2 - \sigma_X \sigma_Y + 3\tau^2}$

Where σ_X and σ_Y are the combined axial and bending stresses in the X and Y directions respectively and τ is the combined shear stress due to torsion and/or bending in the X–Y plane.

5.7 Testing

5.7.1 Works tests are to be carried out in the presence of the Surveyor, on at least one of the winch or windlass units out of the total outfit for the vessel. The tests to be carried out are given in *Table 8.5.4 Works test*. Alternatively, where a prototype winch has been suitably tested, consideration will be given to the acceptance of these results.

Table 8.5.4 Works test

Test	Test load
Static brake — Primary	100% Anchor line break strength (or 80% where stopper fitted. <i>See Pt 7, Ch 8, 5.5 Winch/ Windlass performance 5.5.1</i>)
Static brake — Secondary	50% Anchor line break strength
Stopper (where fitted)	100% Anchor line break strength
Motor stall test	Specified stall load

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 6

5.7.2 The residual braking capability (see *Pt 7, Ch 8, 5.5 Winch/Windlass performance 5.5.4*) is to be verified.

5.7.3 Each winch or windlass is to be tested on board the vessel, in the presence of the Surveyor, to demonstrate that all main aspects, including dynamic brakes, function satisfactorily. The proposed test programme is to be submitted.

5.8 Type approval

5.8.1 Winches or windlasses may be type approved in accordance with LR's Type Approval Scheme. Where this type approval is obtained, the requirements of *Pt 7, Ch 8, 5.7 Testing 5.7.1* may not be applicable.

Section 6

Electrical and control equipment

6.1 General

6.1.1 The electrical installation is to be designed, constructed and installed in accordance with the relevant requirements of *Pt 6, Ch 2 Electrical Engineering*.

6.1.2 Control, alarm and safety systems are to be designed, constructed and installed, in accordance with the relevant requirements of *Pt 6, Ch 1 Control Engineering Systems*, together with the requirements of *Pt 7, Ch 8, 6.2 Control stations to Pt 7, Ch 8, 6.4 Controls*.

6.2 Control stations

6.2.1 The operation of winches, windlasses and associated brakes, chainstoppers and pawls is to be controlled locally from weather-protected control stations which provide good visibility of the equipment and associated anchor handling operations.

6.2.2 A central control station, which may be located on the bridge or a separate manned control room, is to be provided from which brakes, chainstoppers and pawls can be remotely released.

6.2.3 For each anchor winch, the respective local control station is to be provided with a means of indicating the following:

- (a) Line tension.
- (b) Length of line paid out.
- (c) Line speed.

6.2.4 The indication required by *Pt 7, Ch 8, 6.2 Control stations 6.2.3* and *Pt 7, Ch 8, 6.2 Control stations 6.2.3.(b)* is to be repeated to the central control station and, in addition, a means of indicating the following is to be provided at this position:

- (a) Mooring patterns and anchor line catenaries.
- (b) Status of winch operation.
- (c) Position and heading, see also *Pt 7, Ch 8, 6.4 Controls 6.4.6*.
- (d) Gangway angle and extension, when applicable.
- (e) Riser angle, when applicable.
- (f) Wind speed and direction, see also *Pt 7, Ch 8, 6.4 Controls 6.4.9*.

6.2.5 Means of voice communication are to be provided between the central control station, each local control station and anchor handling vessels, when applicable.

6.3 Alarms

6.3.1 Alarms are to be provided at the local and central control stations for the following fault conditions:

- (a) Excessive line tension.
- (b) Loss of line tension.
- (c) Excessive gangway angle and extension, when applicable.
- (d) Excessive riser angle, when applicable.

6.3.2 Alarms are to be provided adjacent to the winches and windlasses to warn personnel prior to and during any remote operation.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 7

6.3.3 Alarms are to be provided at the central control station for the following fault conditions:

- (a) When the ship deviates from its predetermined area of operation.
- (b) When the ship deviates from its predetermined heading limits.

These alarms are to be adjustable, but should not exceed specified limits. Arrangements are to be provided to fix and identify their set points.

6.4 Controls

6.4.1 Adequate controls are to be provided at the local control station for satisfactory operation of the winch(es).

6.4.2 The braking system is to be arranged so that the brakes, when applied, are not released in the event of a failure of the normal power supply.

6.4.3 Standby power is to be provided to enable winch brakes to be released within 15 seconds in an emergency. The release arrangements are to be operable locally at each winch and from the central control position, and are to be such that the entire anchor line can be lowered in a controlled manner.

6.4.4 The standby power is to be such that, during lowering of the anchor line, it is possible to apply the brakes once and then release them again in a controlled manner.

6.4.5 Standby power is to be provided, so that any anchor line stoppers or pawl mechanisms may be released from either the local or central control stations up to a line tension equal to the minimum rated break strength of the anchor line. These mechanisms are to be capable of release at the maximum angles of heel and trim under the damage stability and flooding conditions for which the ship is designed.

6.4.6 At least one position reference system and one gyrocompass or equivalent is to be provided, when applicable, to ensure the specified area of operation and heading deviation can be effectively monitored.

6.4.7 Position reference systems are to incorporate suitable position measurement techniques which may be by means of acoustic devices, radio, radar, taut wire, riser angle, gangway extension and angle or other acceptable means depending on the service conditions for which the ship is intended.

6.4.8 A vertical reference sensor is to be provided, if applicable, to measure the pitch and roll of the ship.

6.4.9 Means are to be provided to ascertain the wind speed and direction acting on the ship.

■ Section 7

Thruster-assisted positional mooring

7.1 General

7.1.1 When the positional mooring system is supplemented by thrusters, the requirements of *Pt 7, Ch 4 Dynamic Positioning Systems*, are to be generally complied with in respect of the machinery, electrical and control engineering arrangements. In applying these requirements, the arrangements for the notations **DP(CM)**, **DP(AM)** and **DP(AA)** may be regarded as equivalent to those for supplementary notations [T1circ] [T2circ] and [T3circ] respectively, unless otherwise stated in this Chapter.

7.2 Control systems

7.2.1 Suitable processing and comparative techniques are to be provided at the central control station to validate the control system inputs, thereby ensuring optimum performance of the thruster-assisted mooring system.

7.2.2 Abnormal signal errors revealed by the validity checks required by *Pt 7, Ch 8, 7.2 Control systems 7.2.1* are to initiate alarms.

7.2.3 The control system is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.

7.2.4 An alarm is to be provided for a control computer system fault.

7.2.5 Sufficient instrumentation is to be fitted at the central control station to ensure effective control and indicate that the system is functioning correctly, *see also Pt 7, Ch 8, 6.2 Control stations*.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 8

7.2.6 The deviation from the desired heading and/or position is to be adjustable, but should not exceed the specified limits. Arrangements are to be provided to fix and identify the set points for the desired heading and/or position.

■ Section 8

Thruster-assisted mooring - Classification notation requirements

8.1 Notations

8.1.1 For assignment of notation **(T1)**, the applicable requirements of *Pt 7, Ch 8, 6 Electrical and control equipment* and *Pt 7, Ch 8, 7 Thruster-assisted positional mooring*, together with *Pt 7, Ch 8, 8.1 Notations 8.1.2*, are to be complied with.

8.1.2 Centralised automated manual control of the thrusters is to be provided to supplement the position mooring system. The manual control system is to provide output signals to the thrusters, via the manual controller, to change the speed, pitch and azimuth angle, as applicable, thereby optimising line tension, as indicated at the central control station, see *Pt 7, Ch 8, 6.2 Control stations 6.2.4*.

8.1.3 For assignment of notation **(T2)**, the applicable requirements of *Pt 7, Ch 8, 6 Electrical and control equipment* and *Pt 7, Ch 8, 7 Thruster-assisted positional mooring*, together with *Pt 7, Ch 8, 8.1 Notations 8.1.4* to *Pt 7, Ch 8, 8.1 Notations 8.1.7* are to be complied with.

8.1.4 Automatic and manual control systems are to be provided to supplement the positional mooring systems and arranged to operate independently, so that failure in one system will not render the other system inoperative. See also *Pt 7, Ch 8, 8.1 Notations 8.1.2* for manual control.

8.1.5 The automatic control system is to utilise automatic input(s) from the position reference system, the environmental sensors and line tensions, and automatically provide output signals to the thrusters to change the speed, pitch and azimuth angle, as applicable, thereby optimising line tension.

8.1.6 In the event of line failure or failure of the most effective thruster, the ship is to be capable of maintaining its predetermined area of operation and desired heading in the environmental conditions for which the ship is designed and/or classed.

8.1.7 Control, alarm and safety systems are to incorporate a computer-based consequence analysis, which may be continuous or at predetermined intervals, and is to analyse the consequence of predetermined failures to verify that the anchor line tensions and position/heading deviations remain within acceptable limits. In the event of a possible hazardous condition arising as a result of the consequence analysis, an alarm is to be initiated at the central control station.

8.1.8 For assignment of notation **(T3)**, the applicable requirements of *Pt 7, Ch 8, 6 Electrical and control equipment* and *Pt 7, Ch 8, 7 Thruster-assisted positional mooring*, together with *Pt 7, Ch 8, 8.1 Notations 8.1.5* to *Pt 7, Ch 8, 8.1 Notations 8.1.7* and *Pt 7, Ch 8, 8.1 Notations 8.1.9* to *Pt 7, Ch 8, 8.1 Notations 8.1.12*, are to be complied with.

8.1.9 Two automatic control systems are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative.

8.1.10 In the event of failure of the working system, the standby automatic control system is to be arranged to changeover automatically without manual intervention and without any adverse effect on the ship's station keeping capability. The automatic changeover is to initiate an alarm.

8.1.11 At least two position reference systems, as defined by *Pt 7, Ch 8, 6.4 Controls 6.4.7*, are to be provided.

8.1.12 At least two of each of the environmental sensors, as required by *Pt 7, Ch 8, 6.4 Controls 6.4.8* and *Pt 7, Ch 8, 6.4 Controls 6.4.9*, are to be provided.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 9

■ Section 9 Trials

9.1 General

9.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, trials are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are to be based on the approved test schedules list as required by *Pt 7, Ch 8, 1.5 Plans and data submission 1.5.4.(h)*.

9.1.2 The suitability of the positional mooring and/or thruster-assisted positional mooring system is to be demonstrated during sea trials, observing the following:

- (a) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power.
- (b) Response of the system under a set of predetermined manoeuvres for changing:
 - (i) Location of area of operation.
 - (ii) Heading of the ship.
- (c) Automatic thruster control and line tension optimisation.
- (d) Monitoring and consequence analyses.
- (e) Simulation of line breakage and damping.
- (f) Continuous operation of the thruster-assisted positional mooring system over a period of four to six hours.

9.1.3 Two copies of the test schedules, as required by *Pt 7, Ch 8, 1.5 Plans and data submission 1.5.4.(h)*, signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed on board the ship and the other submitted to LR.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 1

Section

- 1 **General requirements**
- 2 **Physical conditions**
- 3 **Workstations**
- 4 **Systems**
- 5 **Integrated Bridge Navigation System – IBS notation**
- 6 **Trials**

■ Section 1 General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to ships where an optional class notation for optimizing environment on the bridge for navigational tasks, including periodic operation of the ship under the supervision of a single watchkeeper on the bridge and/or integrated bridge systems, is requested, and are additional to those applicable in other Parts of the Rules.

1.1.2 The requirements of this Chapter are based on the understanding that the *International Regulations for Preventing Collisions at Sea* and all other relevant Regulations relating to Radio Communications and Safety of Navigation required by *Chapter IV - Radiocommunications* and *Chapter V - Safety of navigation* respectively of SOLAS are complied with.

1.1.3 Requirements additional to those in this Chapter may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction it is intended to operate.

1.1.4 The requirements of this Chapter are framed on the understanding that contingency plans for emergencies are specified and the conditions under which one man watch is permitted are clearly defined in an operations manual which is acceptable to the Administration with which the ship is registered.

1.1.5 In general, ships complying with the requirements of *Pt 7, Ch 9, 1 General requirements* to *Pt 7, Ch 9, 4 Systems* of this Chapter will be eligible for the notation **NAV1**.

1.1.6 *Pt 7, Ch 9, 5 Integrated Bridge Navigation System – IBS notation* of this Chapter states additional requirements which shall apply where the navigational functions are integrated. In general, ships complying with the requirements of *Pt 7, Ch 9, 5 Integrated Bridge Navigation System – IBS notation* will be eligible for the notation **IBS**, see *Pt 1, Ch 2, 2.4 Class notations (machinery)*. In addition to the assessment of the navigational function integration, the assignment of the notation **IBS** requires that the layout of the bridge and the equipment located on the bridge is to the satisfaction of Lloyd's Register (hereinafter referred to as LR), see *Pt 7, Ch 9, 5.2 General requirements 5.2.1*.

1.2 Information and plans required to be submitted

1.2.1 The following information and plans are to be submitted in triplicate:

- For programmable electronic systems, the plans required by *Pt 6, Ch 1, 1.2 Documentation required for design review 1.2.6*.
- Details of the intended area of operation of the ship.
- List of navigational equipment detailing manufacturer, and model and National Authority approval (where applicable).
- Functional block diagrams and descriptions of the navigational equipment, internal communications systems and watch safety system indicating their relationship to each other.
- Details of the electrical power supplies to the navigational equipment, internal communications systems, watch safety system, and clear view arrangements.
- A general arrangement of the ship showing the fields of vision from the bridge.
- A general arrangement of the bridge and wheelhouse showing the positions of consoles, panels, handrails, seating, windows and clear view arrangements.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 2

- A profile view of the wheelhouse detailing the inclination of windows, heights of upper and lower edges of windows, and dimensions of consoles.
- Detailed arrangements of consoles and panels showing the layout of equipment.
- Test schedules which should include methods of testing and test facilities provided.
- A schedule of the electrical and electronic equipment referred to in *Pt 7, Ch 9, 2.2 Environment 2.2.10* giving details of:
 - equipment description;
 - manufacturer;
 - type and/or model; and
 - evidence of electromagnetic compatibility.

1.3 Definitions

1.3.1 The following definitions are applicable to these Rules:

(a) **Workstation:**

A position at which one or several tasks, constituting a particular activity, is carried out.

(b) **Navigation workstation:**

A workstation at which the navigator may carry out all tasks relevant for deciding, executing and maintaining course and speed in relation to waters and traffic. The instrumentation and controls at the navigation workstation should allow the navigator to:

- analyse the traffic situation;
- monitor position, course, track, speed, time, propeller revolutions and pitch, rudder angle, depth of water, rate of turn, and wind speed and direction;
- alter course and speed;
- effect internal and external communications;
- give and receive sound signals;
- control navigational lights;
- monitor and acknowledge navigational alarms and warnings;
- confirm his well-being and watch-keeping awareness; and
- record navigational data.

(c) **Main steering position:**

That part of the navigation workstation where those controls and instrumentation relevant to controlling the ship's course are located.

(d) **Conning position:**

A place on the bridge which is used by navigators when commanding, manoeuvring and controlling a ship.

(e) **Voyage planning workstation:** A workstation at which the navigator may carry out the following tasks without affecting the actual navigation of the vessel:

- examine and update charts and other relevant documentation;
- plan a voyage as a series of waypoints, courses, speeds and turns;
- calculate an estimated time of arrival at various points on the voyage; and
- determine and plot the ship's position.

■ Section 2

Physical conditions

2.1 Bridge and wheelhouse arrangement

2.1.1 The bridge configuration, arrangement of consoles and equipment location are to be such as to enable the officer of the watch to perform navigational tasks and other functions allocated to the bridge, as well as maintain an effective lookout. The following tasks are to be supported:

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 2

- navigation and manoeuvring;
- monitoring;
- manual steering;
- docking;
- planning;
- safety;
- communications; and
- conning.

2.1.2 Equipment and associated displays and indicators are to be sited at clearly defined workstations.

2.1.3 Consoles, including the chart table, are to be positioned, so that the instrumentation they contain is mounted in such a manner as to face a person looking forward. As far as practicable, operating surfaces are to be normal to the operator's line of sight.

2.1.4 From other workstations within the wheelhouse it is to be possible to monitor the navigation workstation and to maintain an effective lookout.

2.1.5 The main access to the bridge is to be by means of an internal stairway. Secondary external access is also to be provided.

2.1.6 Clear passage of at least 700 mm width is to be available to allow movement around the bridge with a minimum of inconvenience. Particular attention is to be paid to the following routes which are to be as direct as possible:

- (a) From bridge wing to bridge wing, a clear passage of at least 1200 mm in width.
- (b) Between the internal entrance to the bridge and the route in *Pt 7, Ch 9, 2.1 Bridge and wheelhouse arrangement 2.1.6* a clear passage of at least 700 mm in width is to be provided.
- (c) Between adjacent workstations, a clear passage of at least 700 mm is to be provided.
- (d) Between the bridge front bulkhead or any consoles and installations placed against the front bulkhead, to any consoles or installations placed away from the bridge front, a clear passage of at least 800 mm is to be provided.

Space necessary for operating at a workstation is to be considered as part of the workstation and is not to be part of the passageway.

2.1.7 The clear height between the wheelhouse deck surface covering and the underside of the deckhead is to be at least 2250 mm. The lower edge of deckhead mounted equipment is to be at least 2100 mm in open areas, passageways and at standing workstations.

2.1.8 Toilet facilities are to be provided on the bridge or adjacent to the bridge on the bridge deck.

2.2 Environment

2.2.1 The bridge is to be free of physical hazards to personnel. There are to be no sharp edges or protuberances and wheelhouse, bridge wing and upper bridge decks are to be free of trip hazards and have non-slip surfaces whether wet or dry.

2.2.2 Sufficient hand-rails or equivalent are to be fitted inside the wheelhouse and around workstations to enable personnel to move or stand safely in bad weather. Protection of stairway openings is to be given special consideration.

2.2.3 Provision for seating is to be made in the wheelhouse. Means for securing the seating are to be provided having regard to storm conditions.

2.2.4 Glare and reflections from surfaces are to be minimised. In this respect, walls, ceilings, consoles, chart tables and other major fittings are to be provided with a suitable low reflective finish. Arrangements are to be provided to prevent the obscuration of information presented on visual display units and instruments which are fitted with transparent covers.

2.2.5 Entrance doors to the wheelhouse are to be securable from the inside, and operable with one hand. Bridge wing doors are not to be self-closing, and are to be provided with means to hold them open. For ships required to comply with the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*, the sealing mechanism of each door is to be such that a rapid and efficient gas and vapour tightening can be ensured.

2.2.6 An adequate air conditioning or mechanical ventilation system, together with sufficient heating according to climatic conditions, is to be provided in order to maintain the temperature of the wheelhouse within the range of 14°C to 30°C and the humidity within the range 20 per cent to 60 per cent. The discharge of hot or cold air is not to be directed towards bridge personnel. Control of this system is to be provided in the wheelhouse.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 2

2.2.7 The noise level on the bridge is not to interfere with verbal communication, mask audible alarm signals, or be uncomfortable to bridge personnel. In this respect, the ambient noise level in the wheelhouse in good weather is not to exceed 65 dB(A).

2.2.8 A sound reception system or alternative means is to allow external sound signals to be heard and their direction determined within the wheelhouse.

2.2.9 Permanently installed electrical and electronic equipment is to be installed so that electromagnetic interference does not affect the proper function of the navigational systems and equipment. Installation of the equipment in accordance with the guidelines and recommendations included in IEC 60533: *Electrical and electronic installations in ships – Electromagnetic compatibility*, or an acceptable equivalent Standard, would generally be considered to meet the requirement.

2.2.10 Permanently installed electrical and electronic equipment, on the bridge and in the vicinity of the bridge, that is not subject to the approval required by *Pt 7, Ch 9, 3.1 Navigation workstation 3.1.13*, is to have undergone electromagnetic compatibility testing that demonstrates the equipment satisfies the conducted and radiated emission requirements of:

- IEC 60533: *Electrical and electronic installations in ships – Electromagnetic compatibility*; or
- IEC 60945: *Maritime navigation and radio communication equipment and systems – General requirements – Methods of testing and required test results*.

Testing in accordance with other appropriate standards is subject to consideration and details are to be submitted.

2.2.11 To demonstrate compliance with *Pt 7, Ch 9, 2.2 Environment 2.2.10*, a schedule of applicable equipment is to be compiled, see *Pt 7, Ch 9, 1.2 Information and plans required to be submitted 1.2.1*. Where it is proposed to add to or modify the equipment referred to in *Pt 7, Ch 9, 2.2 Environment 2.2.10* the schedule is to be maintained accordingly, see also *Pt 7, Ch 9, 6.1 General 6.1.1*. A copy of the schedule documentation is to be placed on board the vessel and a copy is to be made available to the LR Surveyor on request.

2.2.12 Passive electromagnetic equipment, considered not liable to cause or be susceptible to electromagnetic disturbances, may be provided with an exemption statement in place of evidence of electromagnetic compatibility for the purposes of *Pt 7, Ch 9, 2.2 Environment 2.2.11*. Examples of passive electromagnetic equipment include cables, purely resistive loads and batteries.

2.3 Lighting

2.3.1 The level of lighting is to enable bridge personnel to perform all bridge tasks, including maintenance and chart and office work, by day and night. Controls, indicators, instruments, keyboards, etc. on the bridge are to be capable of being seen in the dark, either by means of internal lighting within the equipment or the wheelhouse lighting system. A satisfactory level of flexibility within the lighting system is to be available to enable the bridge personnel to adjust the lighting in brightness and direction as required in different areas of the bridge and by the needs of individual instruments and controls.

2.3.2 All illumination and lighting of instruments, keyboards and controls are to be adjustable down to zero, except the lighting of alarm and warning indicators and the controls of dimmers which are to remain readable.

2.3.3 Two separate circuits are to be provided for wheelhouse lighting, such that failure of any one of the circuits does not leave the space in darkness, see *Pt 6, Ch 2, 5.7 Lighting circuits*.

2.3.4 Emergency lighting is to be provided for the wheelhouse, stairways and exits, see *Pt 6, Ch 2, 3 Emergency source of electrical power*.

2.3.5 Lighting used in areas and at items of equipment requiring illumination, whilst the ship is navigating, is to be such that night vision is not impaired, e.g. red lighting. Such lighting is to be arranged, so that it cannot be mistaken for a navigation light by another ship, and to prevent glare and stray image reflections.

2.3.6 In order to avoid possible confusion in colour discrimination, red lighting is not to be fitted over chart tables.

2.3.7 To avoid unnecessary light sources in the front area of the bridge, only instruments necessary for the safe navigation and manoeuvring of the ship are to be located in this area.

2.3.8 Means are to be provided to prevent the sudden flooding of light onto the bridge from alleyways, accommodation areas and the chart table area.

2.3.9 Deck and superstructure lights which may impair safe navigation are to be controlled from the bridge.

2.3.10 Each navigation light is to be provided with an audible and visual alarm to indicate failure of the light, see *Pt 6, Ch 2, 15.6 Navigation lights*.

2.3.11 Means are to be provided to test alarm and other indicator lamps.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 2

2.4 Windows

2.4.1 All wheelhouse windows are to be constructed of shatterproof toughened glass having a strength commensurate with the degree of exposure of the bridge to storm conditions and complying with a recognised National or International Standard, e.g. ISO 21005, *Ships and marine technology – Thermally toughened safetyglass panes for windows and side scuttles*.

2.4.2 Windows are to be as wide as possible and divisions between them are to be kept to a minimum. No division is to be positioned immediately forward of any workstation or on the ship's centreline.

2.4.3 To reduce reflections from internal lighting, etc. the bridge windows are to be inclined from the vertical plane top out, at an angle of not less than 10° and not more than 25°. Alternative arrangements will be specially considered.

2.4.4 The height of the lower edge of the front windows is to allow a forward view over the bow for a person at the navigation workstation and is not to obstruct any of the required fields of vision, see *Pt 7, Ch 9, 2.5 Fields of vision*. In this respect, the height of the lower edge of the front windows above the deck is to be kept as low as possible and, as far as practicable, is not to be more than 1000 mm above the deck surface.

2.4.5 The upper edge of the front windows is to allow a forward view of the horizon for a person with an eyeheight of 1800 mm at the conning position when the ship is pitching in heavy seas and, as far as practicable, is not to be less than 2000 mm above the deck surface.

2.4.6 Clear views through the windows in front of the conning position, navigation workstation, and, where applicable, bridge wings are to be provided at all times regardless of weather conditions. At least two windows are to provide such a view.

2.4.7 To ensure a clear view in bright sunshine, sunscreens with minimum colour distortion are to be provided. Such screens are to be readily removable and not permanently installed. Polarised and tinted windows are not to be fitted.

2.4.8 Heavy duty wipers, preferably provided with an interval function and a fresh water wash, are to be fitted.

2.4.9 Efficient cleaning, de-icing and de-misting systems are to be fitted.

2.4.10 Suitable safe external access arrangements fitted under the bridge windows are to be provided to enable cleaning in the event of failure of the above systems.

2.5 Fields of vision

2.5.1 It is to be possible to observe all objects necessary for navigation, including other traffic and navigation marks, in any direction from inside the wheelhouse. In this respect there is to be a field of view around the vessel of 360° obtained by an observer moving within the confines of the wheelhouse.

2.5.2 The view of the sea surface from the conning position and the navigation workstation is not to be obscured by more than two ship lengths, or 500 m, whichever is less, forward of the bow to 10° on either side, irrespective of the ship's draught, trim and deck cargo, see *Figure 9.2.1 View of sea surface from conning position and navigation workstation*.

2.5.3 Blind sectors caused by cargo, cargo gear and other obstructions outside the wheelhouse forward of the beam obstructing the view of the sea surface as seen from the conning position and the navigation workstation are not to exceed 10° each. The total arc of blind sectors is not to exceed 20° and the clear sector between blind sectors shall be at least 5°. However, in the view described in the preceding paragraph, each individual blind sector is not to exceed 5°.

2.5.4 The horizontal field of vision from the conning position and the navigation workstation is to extend over an arc from more than 22,5° abaft the beam on one side, through forward, to more than 22,5° abaft the beam on the other side, see *Figure 9.2.2 Horizontal field of view from conning position and navigation workstation*.

2.5.5 From the main steering position, the field of vision is to extend over an arc from dead ahead to at least 60° on each side, see *Figure 9.2.3 Field of view from main steering position*.

2.5.6 From each bridge wing, the field of vision is to extend over an arc from at least 45° on the opposite bow through dead ahead and then aft to 180° from dead ahead, see *Figure 9.2.4 Field of view from starboard bridge wing*.

Figure 9.2.1 View of sea surface from conning position and navigation workstation

Figure 9.2.2 Horizontal field of view from conning position and navigation workstation

Figure 9.2.3 Field of view from main steering position

Figure 9.2.4 Field of view from starboard bridge wing

2.5.7 There is to be a line of sight from the port wing to the starboard wing through the wheelhouse.

2.5.8 The ship's side is to be visible from the bridge wing.

2.5.9 From workstations for functions other than navigation, the field of vision is to enable an effective lookout to be maintained and, in this respect, is to extend at least over an arc from 90° on the port bow, through forward, to 22,5° abaft the beam on the starboard side, see *Figure 9.2.5 Field of view from workstation other than for navigation*.

2.5.10 The height of consoles is not to interfere with the fields of vision defined above and is not to exceed 1350 mm.

Figure 9.2.5 Field of view from workstation other than for navigation

■ Section 3 Workstations

3.1 Navigation workstation

3.1.1 A workstation for navigation is to be arranged to enable efficient operation by one person under normal operating conditions. The workstation area is to be sufficient to allow at least two operators to use the equipment simultaneously. The arrangement of instruments and controls is to allow the use of all instruments and controls necessary for navigating and manoeuvring in any normal working position.

3.1.2 An adequate conning position is to be provided close to the forward centre window. If the view in the centreline is obstructed by large masts, cranes, etc. two additional conning positions giving a clear view ahead are to be provided, one on the port side and one on the starboard side of the centreline, no more than 5 m apart. In addition to the conning position, a second position with a view of the area immediately in front of the bridge superstructure is to be provided close to a forward window or, alternatively, the conning position is to be wide enough to accommodate two persons.

3.1.3 The main steering position is to be located on the ship's centreline, unless the view ahead is obstructed by large masts, cranes, etc. In this case, the steering position is to be located a distance to starboard of the centreline sufficient to obtain a clear view ahead and special steering references for use by day and night are to be provided, e.g. sighting marks forward.

3.1.4 The following facilities are to be provided at the navigation workstation:

- Radar and radar plotting facilities, *see Pt 7, Ch 9, 3.1 Navigation workstation 3.1.5.*
- Position-fixing system displays, *see Pt 7, Ch 9, 3.1 Navigation workstation 3.1.6.*
- Echo sounder display.
- Speed and distance indications, *see Pt 7, Ch 9, 3.1 Navigation workstation 3.1.11 and Pt 7, Ch 9, 3.1 Navigation workstation 3.1.12.*
- Gyrocompass display, *see Pt 7, Ch 9, 3.1 Navigation workstation 3.1.7.*
- Magnetic compass display.
- Wind speed and direction indication.
- Steering controls and indication, *see Pt 5, Ch 19, 5 Electric power circuits, electric control circuits, monitoring and alarms.*
- Rate of turn indication.
- Course/track controls and indications, *see Pt 7, Ch 9, 3.1 Navigation workstation 3.1.8.*
- Main propulsion and thruster controls and indication, *see Pt 6, Ch 1, 2.6 Bridge control for main propulsion machinery and Pt 5, Ch 7, 5.3 Controllable pitch propellers and transverse thrust units.*
- Watch safety system acknowledge.
- Watch safety system manual initiation.
- Internal communications system.
- VHF radiotelephone.
- Time indication.
- Window clear view controls.
- Navigation lights controls.
- Whistle control.
- Morse light keys.
- Wheelhouse/equipment lighting controls.
- Automatic ship identification system (AIS) information.
- Sound reception system where fitted, *see Pt 7, Ch 9, 2.2 Environment 2.2.8.*
- Means to cease the distribution of long-range identification and tracking information, where required by SOLAS Ch V, *Regulation 19 - Carriage requirements for shipborne navigational systems and equipment.*

3.1.5 Two functionally independent radars or alternative means are to be provided to determine and display the range and bearing of radar transponders and other surface craft, obstructions, buoys, shorelines and navigational marks. One of the radars is to operate in the X-band (9 GHz) and the other is to operate in the S-band (3 GHz).

3.1.6 At least two different automatic position-fixing systems giving a continuous display of latitude and longitude are to be provided in the interests of redundancy and diversity. One of these is to be GPS or equivalent. The other is to be a system

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 4

providing similar global coverage such as GLONASS, where available. When a second GPS receiver is installed to satisfy this requirement, at least one of the receivers is to be provided with differential correction functionality (DGPS) and the receivers are to be arranged to operate independently as far as is practicable.

3.1.7 A gyrocompass or alternative means for determining, displaying and transmitting the ship's heading by shipborne, non-magnetic means, is to be provided and is to be clearly readable by the helmsman at the main steering position. The heading information is to be used directly by the radars, radar plotting aids and automatic identification system, see *Pt 7, Ch 9, 3.1 Navigation workstation 3.1.5* and *Pt 7, Ch 9, 3.1 Navigation workstation 3.1.13*. The gyrocompass is to be provided with a gyrocompass heading repeater located at the emergency steering position in the steering gear compartment and a gyrocompass bearing repeater allowing bearings to be taken over 360°.

3.1.8 An autopilot, track control system or alternative means of automatically maintaining the ship's heading or a straight track is to be provided. At any time, it is to be possible to immediately restore manual control.

3.1.9 Heading monitoring is to be provided to monitor the actual heading information by independent heading sources. An off-course warning is to be given if the actual heading of the ship deviates from the set track course beyond a pre-set value. The pre-set off-course warning limit is to be large enough to prevent unnecessary alarms.

3.1.10 Where automatic track following is provided, sufficient warning is to be given of the approach of a waypoint, so that, in the event of no acknowledgment from the officer of the watch, there is adequate time for the backup navigator to reach the bridge and accept the change of course.

3.1.11 A speed log or alternative means of indicating the ship's speed and distance through water is to be provided. The speed through water measurement is to be used directly by the ARPA as an aid to collision avoidance.

3.1.12 A speed log or alternative means of indicating the ship's speed and distance over ground is to be provided, which is to be separate from the device required by *Pt 7, Ch 9, 3.1 Navigation workstation 3.1.11*. Speed over ground is to be indicated in both the fore-aft and athwartships directions.

3.1.13 Navigational systems and equipment are to be of a type approved by the national administration and in conformity with appropriate performance standards not inferior to those adopted by IMO from time to time. Documentary evidence to this effect is to be submitted. See SOLAS 1974 as amended, Ch V, *Regulation 18 - Approval, surveys and performance standards of navigational systems and equipment and voyage data recorder*.

3.1.14 Where alternative means of fulfilling the navigational requirements are permitted, the means are to be approved by the national administration and in conformity with appropriate performance standards.

3.2 Voyage planning workstation

3.2.1 A voyage planning workstation is to be provided at which the following facilities are available:

- Chart display and information facilities.
- Position-fixing systems.
- Time indication.

3.2.2 Time indication at the voyage planning workstation is to be derived from the same system as used at the navigation workstation.

3.2.3 An Electronic Chart Display and Information System (ECDIS) is to be provided. Chart tables for paper charts, where provided, are to be large enough to accommodate all chart sizes normally used internationally for maritime traffic and are to have facilities for illuminating the chart, see also *Pt 7, Ch 9, 2.3 Lighting 2.3.8*.

■ Section 4 Systems

4.1 Alarm and warning systems

4.1.1 Alarms associated with navigation equipment are to be both audible and visual and are to be centralised for efficient identification. Repeater displays may be fitted on the bridge wings and at other appropriate positions on the bridge where necessary.

4.1.2 The following alarms are to be provided:

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 4

- Closest point of approach.
- Shallow depth.
- Waypoint approaching (where automatic track following is provided).
- Off-course.
- Off-track (where automatic track following is provided).
- Steering alarms, see *Table 19.5.1 Alarms in Pt 5, Ch 19 Steering Systems* or *Table 20.4.1 Alarms for control systems in Pt 5, Ch 20 Azimuth Thrusters*, as applicable.
- Navigation light failure alarms, see *Pt 6, Ch 2, 15.6 Navigation lights*, including *Pt 6, Ch 2, 15.6 Navigation lights 15.6.8* for grouping.
- Gyrocompass failure.
- Watch safety system failure.
- Failure of any power supply to the distribution panels referred to in *Pt 7, Ch 9, 4.4 Power supplies 4.4.1*.

4.1.3 Audible signals are to be designed not to startle operators. Suitable types are shown in *Table 9.4.1 Suitable audible signals*.

Table 9.4.1 Suitable audible signals

Type	Typical characteristics	Considerations
Buzzer	Low intensity and frequencies	Good alerting in quiet environment without startling
Bell	Moderate intensity and frequencies	Penetrates low frequency noise well, abrupt onset has a high alert value
Chime	Moderate intensity and frequencies	Good in quiet environment, non-startling
Tone	Moderate intensity and limited frequency range	Convenient for intercom transmission, high alert value if intermittent

4.1.4 In the event that any alarm initiated by navigation equipment on the navigating bridge has not been acknowledged on the bridge within a period of 30 seconds, a visual and audible alarm is to be initiated immediately to warn the appointed back-up navigator and/or the Master.

4.1.5 In the event that the alarm required by *Pt 7, Ch 9, 4.1 Alarm and warning systems 4.1.4* is not acknowledged, the system is to initiate an alarm at the locations of further crew members capable of taking corrective actions following a time delay sufficient to allow the Master or back-up navigator to reach the bridge. The time interval is to be adjustable between 90 seconds up to a maximum of 3 minutes. In ships, other than passenger ships, the alarm to warn the further crew members may be initiated at the same time as the alarm to warn the Master and back-up navigator.

4.1.6 The functionality specified in *Pt 7, Ch 9, 4.1 Alarm and warning systems 4.1.4* and *Pt 7, Ch 9, 4.1 Alarm and warning systems 4.1.5* may be incorporated in the watch safety system required by *Pt 7, Ch 9, 4.2 Watch safety system*, or in another fixed system.

4.2 Watch safety system

4.2.1 A watch safety system satisfying the requirements of the IMO Resolution MSC.128(75) - *Performance Standards for a Bridge Navigational Watch Alarm System (BNWAS)* - (adopted on 20 May 2002) and approved by the national administration is to be provided to monitor the well-being and awareness of the watchkeeper.

4.2.2 If, depending upon the shipboard work organisation, the backup navigator may attend locations not connected to the alarm transfer system, a wireless portable device is to be provided enabling both the transfer of alarms and two-way speech communication with the bridge. An audible warning from the portable device is to be provided in the event of loss of the wireless link with the bridge. Alternative arrangements will be considered.

4.2.3 Acknowledgement of any alarm is to automatically reset the time interval between warnings. Manual adjustment of controls may also be used for this purpose. Manual adjustment of controls and navigation equipment (see also *Pt 7, Ch 9, 5.3*

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 5

Equipment 5.3.14) is to automatically reset the watch safety interval timer. Reset arrangements based on the detection of movement in the bridge are not considered to satisfy this requirement or to confirm well-being and watch-keeping awareness.

4.3 Communications

4.3.1 A telephone system is to be provided to enable two-way speech communication between the wheelhouse and at least the following locations:

- machinery control station space, see *Pt 6, Ch 1, 2.6 Bridge control for main propulsion machinery 2.6.7*;
- emergency steering position in the steering gear compartment;
- Master's and Navigating Officers' cabins, offices, mess and public rooms.

4.3.2 The bridge is to have priority over the system.

4.3.3 A list of extension numbers is to be clearly displayed adjacent to each telephone.

4.4 Power supplies

4.4.1 Local distribution panels are to be provided for all items of electrically operated navigational equipment, the telephone system, the watch safety system and the clear view systems. These panels are to be supplied by two exclusive circuits, one fed from the main source of electrical power and one fed from an emergency source of electrical power. Each item of equipment is to be individually connected to its distribution panel. The power supplies to the distribution panels are to be arranged with automatic changeover facilities between the two sources, see also *Pt 6, Ch 2, 15.7 Navigational aids*. Failure of any power supply to the distribution panels is to initiate an audible and visual alarm. This alarm should be included in the ship's alarm system, as required by *Pt 6, Ch 1, 4.2 Alarm system for machinery*, where applicable.

4.4.2 The watch safety system and the telephone system are to remain operational during blackout conditions.

4.4.3 Following a loss of power which has lasted for 45 seconds or less, all navigation functions are to be readily re-instated. In this respect, all navigational equipment is to recover within five minutes, with minimum operator intervention, by virtue of the emergency source and, where necessary, an uninterruptible power source.

■ Section 5 Integrated Bridge Navigation System – IBS notation

5.1 General

5.1.1 Where it is proposed that the bridge navigation functions are so arranged as to form an integrated bridge system, the requirements of *Pt 7, Ch 9, 5.2 General requirements* are to be complied with.

5.2 General requirements

5.2.1 For assignment of the notation **IBS**, in addition to satisfying the other requirements of this Section:

- (a) the layout of the bridge and the equipment located on the bridge is to satisfy the requirements of a relevant international or national ergonomic or human-centred design Standard or an acceptable equivalent; or
- (b) the notation **NAV1** is also to be assigned and the layout of the bridge and the equipment on the bridge are to satisfy the requirements *Pt 7, Ch 9, 1 General requirements* to *Pt 7, Ch 9, 4 Systems*; or
- (c) where the bridge is not intended to operate a periodic one man watch, the layout of the bridge and the equipment on the bridge are to satisfy the requirements of *Pt 7, Ch 9, 1 General requirements* to *Pt 7, Ch 9, 4 Systems*, with the exception that the requirements of *Pt 7, Ch 9, 4.3 Communications* may be relaxed.

5.2.2 Where *Pt 7, Ch 9, 5.2 General requirements 5.2.1(a)* is applicable, the submissions required by *Pt 7, Ch 9, 1.2 Information and plans required to be submitted 1.2.1* are to include evidence demonstrating satisfaction of the requirements of an identified relevant Standard.

5.2.3 To satisfy *Pt 7, Ch 9, 5.2 General requirements 5.2.2*, the evidence submitted is to:

- (a) be submitted to LR for assessment, including identification of testing necessary to verify compliance in the submitted test schedules; or

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 5

- (b) include relevant statutory documentation demonstrating compliance with the relevant identified standard to the satisfaction of the National Administration. Such documentation is to be submitted prior to the assignment of the **IBS** notation. This may necessitate co-ordination of classification and statutory Surveys, particularly for new construction, before the **IBS** notation may be assigned.

5.2.4 Where *Pt 7, Ch 9, 5.2 General requirements 5.2.1(c)* is applicable, the submissions required by *Pt 7, Ch 9, 1.2 Information and plans required to be submitted 1.2.1* are to include plans and information for the consideration of LR which demonstrate that the applicable requirements of *Pt 7, Ch 9, 1 General requirements to Pt 7, Ch 9, 4 Systems* have been satisfied.

5.2.5 The design features for computer hardware, local area networks and software required by *Pt 6, Ch 1, 2.10 Programmable electronic systems - General requirements*, *Pt 6, Ch 1, 2.11 Data communication links*, *Pt 6, Ch 1, 2.13 Programmable electronic systems - Additional requirements for essential services and safety critical systems* and *Pt 6, Ch 1, 2.14 Programmable electronic systems - Additional requirements for integrated systems* respectively are to be complied with. Alarms and warnings associated with hardware and data communication are to be incorporated in the centralised alarm system required by *Pt 7, Ch 9, 4.1 Alarm and warning systems*.

5.2.6 Failure of a part of the integrated bridge navigation system is not to affect other parts except for those that directly depend upon the information from the defective part. Following such a failure, it is to be possible to operate each other part of the system separately.

5.3 Equipment

5.3.1 Two independent gyrocompasses are to be available to provide heading information to the system. The heading signal from each gyrocompass is to be continuously available for display and for providing input to all relevant items of navigational equipment.

5.3.2 Only one gyrocompass is to be used by the integrated bridge system at any time for main display and control purposes. The navigating officer is to be able to switch between compasses at any time. The non-selected compass is to be automatically used as the independent heading source for the off-course warning required by *Pt 7, Ch 9, 3.1 Navigation workstation 3.1.9*.

5.3.3 It is to be possible to compare readings from each gyrocompass via the navigation workstation displays.

5.3.4 Automatic comparison between the gyrocompasses is to be provided and an alarm given if the difference between heading signals exceeds a pre-set value.

5.3.5 The capability to receive and utilise differential GPS corrections (or an equivalent) is to be included in the integrated bridge system.

5.3.6 As a minimum, the following information is to be displayed at the navigation workstation via visual display units:

- Steering mode.
- Gyro heading.
- Course to steer.
- Rate of turn.
- Rate of turn order.
- Speed and distance (from log and from GPS).
- Speed order.
- Waypoint bearing, distance and ETA.
- Water depth and alarm setpoint.
- Position fix from each available system.
- Main propulsion and thruster indication, see *Pt 6, Ch 1, 2.6 Bridge control for main propulsion machinery* and *Pt 5, Ch 7, 5.3 Controllable pitch propellers and transverse thrust units*.
- Steering indication, see *Pt 5, Ch 19, 5 Electric power circuits, electric control circuits, monitoring and alarms*.
- Wind speed and direction.
- Time, see *Pt 7, Ch 9, 3.2 Voyage planning workstation 3.2.2*.

5.3.7 Additional information such as machinery monitoring, fire detection, cargo control, etc. may also be provided via additional pages on the visual display units.

5.3.8 The centralised alarm system and the watch safety system required by *Pt 7, Ch 9, 4.1 Alarm and warning systems* and *Pt 7, Ch 9, 4.2 Watch safety system* respectively are to be incorporated as functions of the integrated bridge system and are to be presented to the navigating officer via the conning display. The presentation and display of alarms and warnings is not to mask,

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 5

obscure or degrade essential information displayed to aid navigational functions and maintain awareness of the navigational information, *see also Pt 7, Ch 9, 5.5 Alarm management*.

5.3.9 A route planning capability is to be provided by the integrated bridge system. This is to allow a voyage to be pre-planned as a series of waypoints and turn radii. It is to be possible to edit a voyage plan at any time without affecting route control and monitoring.

5.3.10 An automatic track following capability is to be provided in conjunction with the pre-planned route. The position fix used by the system is to be based at least upon GPS or equivalent, and is to be cross-checked by dead-reckoning, based upon speed over ground provided by the ship's log. In areas where differential corrections are available, it is to be possible to utilise these in the track following system.

5.3.11 In the event of failure of the track following capability the current heading or rate of turn is to be maintained until manually altered by the navigating officer. The quality of position fix input to the system is to be monitored, *see also Pt 7, Ch 9, 3.1 Navigation workstation 3.1.10 and Pt 7, Ch 9, 4.1 Alarm and warning systems 4.1.2*.

5.3.12 The integrated bridge system is to incorporate a display, which combines simultaneously the ECDIS high resolution colour representation of a nautical chart with a continuously updated record of own ship's position, pre-planned track, and radar targets in the vicinity. The entire tactical situation is to be displayed for the navigating officer in such a way that any risk from approaching, overtaking or crossing vessels may be assessed. Factors affecting the vessel's freedom to manoeuvre, such as water depths, channel boundaries, separation zones and other traffic are to be shown on the display.

5.3.13 The following alarms are to be provided and included in the centralised alarm system specified by *Pt 7, Ch 9, 4.1 Alarm and warning systems 4.1.1*:

- Off-track
- Waypoint approaching, *see Pt 7, Ch 9, 3.1 Navigation workstation 3.1.10*.
- Position fix inaccurate/lost.
- Loss of heading input.
- Loss of log input.
- Equipment or sub-system failure.
- Gyro mis-match.

5.3.14 Manual adjustment of any of the facilities of the integrated bridge system is to reset automatically the watch safety interval timer.

5.4 Operator interface

5.4.1 Integrated display and control functions are to adopt a consistent man-machine interface philosophy and strategy. Particular consideration is to be paid to symbols, colours, controls, and information priorities.

5.4.2 The size, colour and density of text and graphic information displayed on a visual display unit is to be such that it may be read easily from the normal operator position under all operational lighting conditions.

5.4.3 Means are to be provided for the manual adjustment of the brightness of each visual display unit.

5.4.4 All information is to be presented on a background of high contrast, emitting as little light as possible by night.

5.4.5 Paged displays are to be presented in a way which allows the operator to find quickly the information needed. An overview page is to be easily available to remind the operator of the paging system.

5.4.6 Pages are to have a standardised format. Particular types of information and functional areas should be presented in a consistent manner, e.g. in the same position on different pages.

5.4.7 Each page is to have a unique identifying label on the screen.

5.4.8 Keyboards are to be divided logically into areas enabling rapid access to a desired function. Alphanumeric, paging and specific system keys are to be grouped separately and grouping is to be identical at all operator interfaces.

5.4.9 Soft keys may be used for display control and operation of systems non-critical to the safe operation of the vessel, otherwise dedicated controls are to be used.

5.4.10 Functions requested by the operator are to be acknowledged and confirmed by the system on completion.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 5

5.4.11 Interfaces are to incorporate the capability for operators readily to decline or override automatic ship control functions critical to safe operation. See *Pt 6, Ch 1, 1.2 Documentation required for design review 1.2.2* regarding submission of information on safety functions and overrides.

5.4.12 Default values, where applicable, are to be indicated by the system when requesting operator input.

5.4.13 If an input error is detected by the system, it is to allow the operator to correct the error immediately.

5.4.14 The system is to require confirmation from the operator for critical actions, e.g. they should not rely on single keystrokes.

5.4.15 Input error messages are to guide the correct responses, e.g.:

use	Invalid entry: re-enter set point between 0 and 10
not	Invalid entry.

5.4.16 All functions of the integrated bridge system are to remain available in the event of a single failure of an operator interface. This is to be achieved through redundancy in the integrated bridge system interfaces.

5.5 Alarm management

5.5.1 All alarms provided on the bridge are to be included in the centralised alarm system required by *Pt 7, Ch 9, 4.1 Alarm and warning systems 4.1.1*.

5.5.2 In general, the alarm system is to be in accordance with *Pt 6, Ch 1, 2.3 Alarm systems, general requirements, A.1021(26) Code on Alerts and Indicators, 2009 and MSC.302(87) Performance Standards for Bridge Alert Management*.

5.5.3 Alarm management on priority and functional levels is to be provided within the integrated bridge system. Alarms and other alerts are to be prioritised according to the urgency and type of response required by the bridge team, as follows:

- (a) **Emergency alarms** — alarms which indicate that immediate danger to human life, or to the ship and its machinery exists, and that immediate action must be taken.
- (b) **Alarms** — conditions requiring immediate attention and action by the bridge team:
 - to avoid any kind of hazardous situation and to maintain the safe operation of the ship, including escalation of unacknowledged warnings; or
 - alerts which indicate that a caller is in distress or has an urgent message to transmit.
- (c) **Warnings** — conditions or situations which require immediate attention for precautionary reasons, to make the bridge team aware of conditions which are not immediately hazardous, but may become so.
- (d) **Cautions** — awareness of a condition which still requires attention out of the ordinary consideration of the situation or of given information.

5.5.4 Appropriate alarm management is to be provided. This includes prioritisation, distribution and recording of alarms and other alerts as required.

5.5.5 Within each priority, alerts are to be arranged in groups in order to reduce the quantity of information presented to the operator. More detailed information on the group alarm is to be readily available from the integrated bridge system on request.

5.5.6 Group alarms may be arranged on the bridge to indicate machinery faults, but alarms associated with faults requiring speed or power reduction or the automatic shutdown of propulsion machinery are to be identified by separate group alarms or by individual alarm parameters.

5.5.7 The following alarms are not to be grouped:

- Emergency alarms.
- Separate group alarms associated with faults requiring speed or power reduction or the automatic shutdown of propulsion machinery.
- Steering gear alarms.
- Navigation light power supply failure alarms, see *Pt 6, Ch 2, 15.6 Navigation lights 15.6.8*.

5.5.8 Alerts are to be displayed in order of priority. Within the priorities, alerts are to be displayed in the order in which they occur. The visual display units are to provide immediate display of new information, regardless of the information display page currently selected. This may be achieved by provision of a dedicated alert monitor, a dedicated area of screen for alerts or other suitable means.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 6

5.5.9 Unacknowledged alarms are to be distinguished by either flashing text or a flashing marker adjacent to the text, and not merely by a change of colour. Acknowledged alarms are to be distinguished by either steady illuminated text or a steady illuminated marker adjacent to the text.

5.5.10 The centralised alarm system is to be capable of displaying at least 20 items simultaneously. There is to be a clear and unambiguous indication that there are additional items requiring attention when the display does not show all active alerts simultaneously, and it is to be possible to display the additional messages and to return to the display containing the highest priority items by single operator actions.

5.5.11 Alerts are to be acknowledged individually. It is to be possible temporarily to silence all audible signals with a single operator action.

5.5.12 The characteristics of audible warning and, where provided, caution signals are to be such that it is possible to differentiate these from audible alarm signals.

5.6 Power supplies

5.6.1 All equipment forming part of the integrated bridge navigation system is to be regarded as navigational equipment and, as such, is to have power supplies in accordance with *Pt 7, Ch 9, 4.4 Power supplies*.

■ Section 6 Trials

6.1 General

6.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, tests are to be carried out to ensure satisfactory operation of the navigational equipment. These tests are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are based on the approved test schedule as required by *Pt 7, Ch 9, 1.2 Information and plans required to be submitted 1.2.1*.

6.1.2 For **IBS** Notation, testing at the manufacturer's works and trials on board are to be carried out that cover the individual components and their interaction; and the bridge functions and their integration to form the Integrated Bridge System.

6.1.3 Two copies of the test schedule, signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed on board the ship and the other submitted to LR.

6.1.4 Acceptance tests and trials for Programmable Electronic Systems are to include verification of software lifecycle activities appropriate to the stage in the system's lifecycle at the time of system examination.

Section

- 1 **General requirements**
- 2 **Plans and documentation**
- 3 **Ventilation and hold temperature**
- 4 **Electrical, including container plug-in sockets**
- 5 **Instrumentation, control and alarm systems**
- 6 **Hold access and maintenance access arrangements**
- 7 **Water cooler refrigeration units**
- 8 **Deck-stowed refrigerated containers**
- 9 **Inspection and testing on completion**
- 10 **Spare gear**

■ *Section 1* **General requirements**

1.1 General

1.1.1 The requirements of this Chapter apply to ships where the class notation **CRC** 'carriage of refrigerated containers' is requested.

1.1.2 This notation may be applied to any ship which has the ability to carry refrigerated containers. The requirements of this Chapter cover refrigerated containers stowed on deck as well as in a hold space. A descriptive notation may be assigned in addition to the **CRC** notation giving details of electrical power and type of cargo.

1.1.3 The requirements are additional to the classification requirements for ships contained in other applicable parts of the Rules.

1.1.4 Ships which comply with the requirements of this Chapter will be eligible for the applicable class notation specified in *Pt 1, Ch 2, 2.6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC))*.

1.1.5 An example of a typical class notation for a container ship classed with LR, fitted with a ventilation system built under Special Survey and fitted with electrical plug-in points for deck stowed refrigerated containers, would be:

- (a) **+ CRC 230/140** to maintain 230 hold-stowed and 140 deck-stowed refrigerated containers operating at their design condition with a 24 hour average external ambient air temperature of 35°C.

1.1.6 An example of a typical class notation for a reefer ship classed with LR, fitted with electrical plug-in points for deck stowed refrigerated containers, would be:

- (a) **+ CRC -/110** to maintain 110 deck-stowed refrigerated containers operating at their design condition with a 24 hour average external ambient air temperature of 35°C.

1.1.7 In addition to any class notation, an appropriate descriptive notation may be assigned to provide additional information about the ship's ability to carry refrigerated containers.

1.1.8 An example of a typical descriptive notation, which may be assigned in addition to the class notation, would be:

- (a) **crc 2,800 kW** provided with a power generating capacity of 2,800 kW dedicated to supplying the container plug-in points.
 (b) **crc 60%/40%** stowage ratio of 60% deep frozen and 40% chilled cargoes

1.1.9 These Rules do not cover any requirements for alarm and monitoring systems that may be fitted to container refrigeration units.

1.2 Novel arrangement and designs

1.2.1 Where the proposed ventilation arrangement is novel in design, or the ventilation system involves the use of an arrangement different from that specified in the following sections, special tests may be required and a suitable descriptive note may be assigned.

1.2.2 The carriage of refrigerated containers in the hold spaces of ships other than dedicated container ships will be given special consideration. The **CRC** and descriptive notations will be assigned provided that the ventilation system is approved, installed and tested in accordance with the requirements of this Chapter.

1.2.3 Where a dedicated fresh water circulation system is installed to supply cooling water to containers fitted with an optional water cooled condenser, the fresh water system will also need to comply with the relevant Sections of *Pt 5, Ch 12 Piping Design Requirements* of the Rules.

1.3 Definitions

1.3.1 **Balanced ventilation system** means a ventilation system consisting of a combination of forced draught and induced or natural draught, to produce a pressure condition in the hold space approximately equal to atmospheric pressure.

1.3.2 **Blackout** means that the main and auxiliary machinery installations, including the main power supply, are out of operation but the services for bringing them into operation (e.g. compressed air, starting current from batteries etc.) are available.

1.3.3 **Container cell** means the position of an individual container. This is usually within a set of vertical cell guides and is normally enclosed by transverse stringers located above and below the container.

1.3.4 **Container electrical power supply** means the generated power supply which is dedicated to supplying the total number of refrigerated containers and the hold ventilation system fan motors.

1.3.5 **Container plug-in point** means an electrical socket located at each applicable container location on deck and each cell location below deck being in accordance with Annex L of ISO 1496-2 : 1996.

1.3.6 **Design conditions** means the lowest design internal container temperature and the design maximum hold space temperature.

1.3.7 **Hold space** means an enclosed space containing refrigerated containers. The containers are usually restrained within cell guides. For hatch coverless ships, hold space means the space below the hatch coamings.

1.3.8 **Independent ventilation system** means a ventilation system that is in no way connected to another ventilation system and there is no provision available to allow connection to another ventilation system.

1.3.9 **Refrigerated container** means a standard container with a self-contained refrigeration system, located within the outer dimensions of the container, which can be driven by electrical power fed from an external power supply. The refrigeration system may be either a 'clip-on' or an integral type of cooling unit.

1.3.10 **Stack factor** means the ratio of the actual heat flowing into the containers forming the stack, to the heat which would flow into the same containers if all their surfaces were completely exposed to the hold temperature.

1.3.11 **Standard container** means a forty-foot equivalent unit (FEU) standard production container constructed in compliance with LR's Container Certification Scheme, or another recognised *Container Certification Scheme* in accordance with ISO 1492/2 requirements. The container may be of the normal or 'high-cube' type.

1.3.12 **Stowage ratio** means the proportion of deepfrozen cargo in relation to banana or chilled cargoes. Unless specifically stated, the stowage ratio will be deemed to be 50 per cent deep-frozen and 50 per cent chilled cargo.

1.3.13 **Ventilation system** means a forced ventilation arrangement using mechanical fans to supply and/or extract air from the hold space.

■ Section 2

Plans and documentation

2.1 General

2.1.1 The following plans and information regarding the hold ventilation systems and the electrical supplies to container plug-in points are to be submitted in triplicate for appraisal before construction is commenced:

(a) **Plans of ventilation arrangements:**

- Location and installation details of each hold space ventilation system showing duct arrangement and sizes.
- Details of all mechanical ventilation fans including locations, number, duty at design conditions and power consumption.
- Details of air inlets including number, type, size and locations.
- Details of air outlets including number, type, size and locations.
- Details and locations of dampers and flaps, if applicable.

(b) **Plans of hold spaces:**

- Refrigerated container stowage plans, including sectional elevation and plan views.
- Design pressure or vacuum in each hold space.
- Details of hatch cover sealing arrangements.
- Personnel access arrangements.
- Details and locations of hold temperature measurement sensors.
- Details of any pressure/vacuum safety valves if applicable.

(c) **Ventilation throughput:**

- Specified air throughput rate and proposed method of measurement.
- Design temperature rise in the hold space and corresponding diurnal external ambient air temperature and relative humidity.
- Schematic arrangement of the ventilation system showing proposed air volume and velocity at junctions.

(d) **Plans of deck-stowed containers:**

- Refrigerated container stowage plans, including sectional elevation and plan views.
- Details of access arrangements for maintenance and monitoring of refrigeration units fitted to deck-stowed containers.

(e) **Hull structure:**

- Details of associated openings through the hull structure are to be submitted.

(f) **Electrical.** In addition to the applicable requirements of *Pt 6, Ch 2, 1.2 Documentation required for design review*, the following information and plans specific to the container plug-in points and ventilation system are to be submitted:

- Power supply arrangements to the deck stowed refrigerated containers.
- Power supply arrangements to the hold space stowed refrigerated containers.
- Power supply arrangements to the ventilation system.
- Single-line diagram of the ventilation system. This is to include rating of motors, insulation type, size and current loading of cables and make, type and rating of protective devices.
- A schedule of normal operating loads of the ventilation system estimated for the design conditions expected.

(g) **Control equipment.** In addition to the applicable requirements of *Pt 6, Ch 1, 1.2 Documentation required for design review*, the following information and plans specific to the ventilation system are to be submitted:

- Line diagram of control circuits.
- List of monitored, control and alarm points.
- Locations of control panels and consoles.
- Details of alarm system, including location of control panel and audible and visual warning devices.

(h) **Testing:**

- Details of the testing and commissioning programme, including instrumentation to be used, are to be submitted.

■ Section 3

Ventilation and hold temperature

3.1 Ventilation system

3.1.1 Means are to be provided to maintain the hold space at an acceptable temperature. This can be achieved by either; the direct removal of the waste heat from the refrigerant equipment of each container, or by the dissipation of the waste heat using large quantities of external ambient air. In each case the system is to be arranged in such a way as to minimise its affect on the hold space temperature. This may be accomplished by the use of a ventilation system of a mechanical supply and/or extract type.

3.1.2 The selection of a maximum allowable hold temperature is to be agreed between the designer and Operator/Owner. Whilst the recommendations given in these Rules do not stipulate a maximum allowable hold temperature, generally it should not exceed 45°C dry bulb. Guidance should be sought from container manufacturers on the maximum allowable ambient air temperature. When determining the maximum allowable hold temperature, the maximum number of refrigerated containers within the hold space, operating at their design condition, is to be taken into consideration.

3.1.3 The ventilation system is to have sufficient capacity to remove or dissipate the heat from each designated refrigerated container cell and maintain the hold temperature at or below the maximum allowable hold temperature.

3.1.4 The volume of air to be supplied or exhausted from a hold space per refrigerated container is at the discretion of the ventilation system designer. For guidance purposes, an indication of the amount of air required for a standard FEU having an air cooled condenser operating at the example notation as stated in *Pt 7, Ch 10, 1.1 General 1.1.5* is as follows:

Simple supply only system 90 m³/min

Supply and exhaust duct system 75 m³/min

Sealed exhaust system 37 m³/min

3.1.5 The design of the hold space is to be compatible with the type of ventilation system proposed. For example, for supply and ducted exhaust systems, the semi enclosure of each stringer level may be beneficial. For a simple supply only system the provision of multiple gratings in each stringer level would benefit the free circulation and removal of warm air.

3.1.6 Only container cells served by the ventilation system are to be used for the transportation of refrigerated containers.

3.1.7 The design heat rejection for each container cell and the total hold space heat rejection, including any heat imparted from the ventilation system fans, if applicable, are to be stated. Guidance on heat rejection values which may be used is given below.

3.1.8 The minimum quantity of air supplied or extracted for each container cell and for each hold space is dependent on the type of system proposed and to be stated.

3.1.9 The ventilation system designer is to stipulate the maximum allowable back pressure occurring within the hold space. Due regard needs to be given to this value when selecting the ventilation fans and their ability to operate efficiently again the proposed maximum back pressure. The lower the back pressure, the more efficient the system and, hence, the lower the electrical power requirement to drive the fan motors for a given air throughput.

3.1.10 For supply air systems, the air outlet at each container location is to be such as to provide a flow of air towards the container's integral refrigeration system. Consideration should be given to the use of movable spigot outlets or ducting to allow both standard and high-cube containers to be stowed in any location.

3.1.11 The positions of supply air inlets and exhaust air outlets are to be such as to reduce the possibility of shortcycling. An adequate distance is to be maintained between inlet and outlet vents on the open deck.

3.1.12 The effect of warm exhaust air on deck-stowed refrigerated containers is to be taken into consideration. Similarly, the effect of warm exhaust air from deck-stowed refrigerated containers on the inlet air to the hold is to be considered.

3.1.13 Arrangements are to be provided to permit a rapid shutdown and effective closure of the ventilation system in each hold space in case of fire.

3.1.14 Ventilation ducts which penetrate the deck and/or hatch coaming, including dampers and / or closures, are to be made of steel and their arrangement is to be to the satisfaction of the relevant Administration. The use of nonmetallic flexible ducts, local to each container location, will be acceptable provided the material demonstrates suitable low flame spread characteristics.

3.2 Heat balance

3.2.1 The amount of heat absorbed from the hold space by each container, which is used to determine the design air change rate, is to be stated.

3.2.2 The heat gain or loss from all adjacent spaces, such as fuel oil tanks, ballast tanks, engine room, etc. is to be stated.

3.2.3 The heat rejection from the refrigeration unit of a standard TEU or FEU container when working at low temperature (minus 18°C), chill temperature (2°C) and banana carriage temperature (13°C), used to determine the design air change rate, is to be stated. The following FEU values may be used for guidance purposes:

Frozen cargo (minus 18°C/38°C). 7,0 kW

Chill cargo (2°C/38°C). 10,0 kW

Banana cargo (13°C/38°C). 13,0 kW.

3.2.4 The above heat rejection values are for the container during normal operation after the cooling down period of a non-precooled cargo.

3.2.5 The stowage ratio, for the carriage of containers at different internal temperatures, which is used to determine the design air change rate, is to be stated.

3.2.6 When an extraction ventilation system is proposed, a stack factor of 0,9 may be used in the heat balance calculations. If a ventilation system using supply air only is proposed, then no stack factor can be allowed.

3.3 Fan redundancy

3.3.1 A single supply or exhaust fan is not to be used for multiple container stack locations.

3.3.2 Individual container cells may be fed by a system having a single mechanical fan or fans to supply and/or extract air.

3.3.3 Installed standby fans are not required. However, a minimum of one replacement fan, or fan blade assembly and motor, of each size is to be carried onboard. Fans are to be arranged to enable each to be replaced whilst the remaining systems remain in operation.

3.4 Hull structures

3.4.1 Special consideration will be given to installations using hull spaces for air distribution, rather than dedicated ductwork.

3.4.2 Consideration is to be given to measures to prevent ingress of water into air inlets and exhaust outlets, where applicable.

■ Section 4

Electrical, including container plug-in sockets

4.1 General

4.1.1 In addition to the requirements of *Pt 6, Ch 2 Electrical Engineering*, the following are to be complied with:

- (a) Electrical power for the ventilation system is to be provided by one or more separate feeder circuit(s) from the main switchboard.
- (b) Under sea-going conditions, the number and rating of service generators are to be sufficient to supply all container plug-in socket outlets and the hold space ventilation system in addition to the ship's essential services, when any one generating set is out of action.

4.1.2 The choice between a low (440 V) or high (6,600 V) distribution system serving the container plug-in point is considered a purely commercial decision. Consideration needs to be given to the fault level of the generating equipment selected and the total generating capacity of the ship. Independent of the system voltage, only the dedicated plug-in socket outlet kW value will be stated in the notation.

4.1.3 Where a distribution system exceeding 1000 V a.c. is employed, the plug-in socket outlets for each hold space may be fed from a local transformer and the following are to be complied with:

- (a) Transformers are to be fed from individual circuits divided between different sections of the main switchboard.

(b) The electrical power for the ventilation system may be fed locally from each transformer.

4.1.4 Container plug-in socket outlets are to comply with the requirements of *Pt 6, Ch 2, 13.6 Socket outlets and plugs*.

4.2 Plug-in socket outlet supply transformers

4.2.1 A standby transformer serving the container plug-in socket outlets is to be provided. However, if the CRC notation is not assigned, then there is no specific requirement covering the installation of a standby power supply.

4.2.2 If a standby transformer is to be provided, then the exact requirements are open to interpretation and consideration should be given to the contents of IACS Unified Interpretation SC 83 with regard to the equipment provided.

4.3 Container plug-in socket outlets

4.3.1 The distribution and sub-circuit cabling for the container plug-in socket outlets is to be rated at the full load capacity (maximum rated capacity).

4.3.2 Groups of container plug-in socket outlets may be fed from a number of independent sub circuits.

4.3.3 Sub circuits are to be able to be individually switched, thus allowing a sequential start up after a prolonged (12 hours) blackout. A suitable procedure is to be proposed and approved that takes into consideration the requirements of *Pt 7, Ch 10, 4.4 Generated power for plug-in socket outlets* in addition to the requirements of *Pt 6, Ch 2 Electrical Engineering*.

4.4 Generated power for plug-in socket outlets

4.4.1 When determining the dedicated generating power for the plug-in socket outlets, the electrical power drawn by the refrigeration unit of a standard TEU and FEU refrigerated container when working at both low temperature (minus 18°C) and chill temperature (2°C), is to be stated.

4.4.2 The following values for various cargoes operating at normal design conditions may be used for guidance purposes:

4.4.3 Twenty foot equivalent unit (TEU):

Frozen cargo (minus 18°C/38°C)	5,5 kW
Chill cargo (2°C/38°C)	7,5 kW
Banana cargo (13°C/38°C)	<i>see Pt 7, Ch 10, 4.4 Generated power for plug-in socket outlets 4.4.5</i>

4.4.4 Forty foot equivalent unit (FEU) including high-cube containers:

Frozen cargo (minus 18°C/38°C)	8,5 kW
Chill cargo (2°C/38°C)	11,0 kW
Banana cargo (13°C/38°C)	<i>see Pt 7, Ch 10, 4.4 Generated power for plug-in socket outlets 4.4.5</i>

4.4.5 If the Owner, charterer or operator has operational data indicating that, for the ship's specific trade (for example banana only cargoes), the power provision for the refrigerated containers requirements exceeds those stated above, then these higher values should be substituted and submitted for consideration.

4.4.6 The above values are for the container during normal operation after the cooling-down period of a non-precooled cargo.

4.4.7 An overall diversity factor may be applied to the container's total power requirement. Consideration is to be given to *Pt 6, Ch 2, 5.6 Diversity factor*. This diversity factor is to be applied to all refrigerated container cell locations. For guidance purposes, the diversity factor is not generally to be less than 0,75.

■ Section 5**Instrumentation, control and alarm systems****5.1 General**

5.1.1 The alarm system is to indicate failure of each independent ventilation system in each hold space. If a balanced ventilation system is proposed, indication of failure for each individual part is to be given. The alarm system may be integral with the machinery space alarm system or, if fitted, the refrigerated container monitoring system.

5.1.2 Alarms are to be initiated in a manned location. Where alarms are displayed as group alarms in the main machinery space alarm system, provision is to be made to identify individual alarms at a separate control panel.

5.1.3 Alarms are to give both an audible and visual warning.

5.2 Hold space temperature monitoring

5.2.1 A minimum of two temperature sensors are to be provided in each hold space carrying refrigerated containers. The sensors are to be positioned to give an indication of the mean air temperature occurring in the hold space used for the carriage of refrigerated containers. Sensors are to be positioned so as not to be directly affected by warm air from the condensers.

5.2.2 The hold temperature is to be continually monitored. Temperatures are to be recorded, either automatically or manually as a hold temperature log. If temperatures are to be logged manually, then the mean temperature in each hold space is to be recorded.

5.2.3 If the mean hold space temperature rises above the design maximum, then an alarm is to be initiated.

5.3 Container refrigeration system alarms

5.3.1 These Rules do not cover any requirements for alarm and monitoring systems fitted to containers. It is acceptable to utilise the container power supply cables to transmit signals to a suitable receiver or data logger.

■ Section 6**Hold access and maintenance access arrangements****6.1 Hold pressure/vacuum**

6.1.1 The maximum permitted pressure or vacuum that may occur in the hold space is to be stated. It is proposed that a value, in accordance with the contents of *Pt 3, Ch 1, 9.7 Definitions and details of tests 9.7.4*, may be considered as a maximum value. An overpressure of 0,015 MPa may be used for guidance purposes. If the ventilation system is capable of producing a positive pressure or vacuum in excess of the design allowable figure, then means are to be provided to protect the hold space against the effect of over pressure or vacuum. If axial supply fans are proposed, even if aerofoil fan blades are fitted, it is unlikely that the fans will be able to produce a pressure above 0,0025 MPa (250 mm water gauge).

6.1.2 If required, consideration is to be given to the use of a pressure or vacuum relief device or other arrangement set to operate below the maximum allowable hold pressure or vacuum.

6.1.3 The proposed pressure or vacuum relief device for each hold space is to be of adequate size.

6.2 Hold access arrangements

6.2.1 Suitable means are to be provided to allow personnel safe access to each hold space when the ventilation system is in operation. Consideration is to be given to the possible over pressure or partial vacuum that may occur in the hold space. The use of an airlock arrangement may need to be considered.

6.3 Maintenance access arrangements

6.3.1 Free access to each applicable container cell and hold space is to be provided to allow replacement of refrigeration equipment in the event of failure or malfunction.

6.3.2 Adequate access is to be provided to allow plugging in, data recording or retrieval and general maintenance of all deck- and hold-stowed refrigerated containers. Suitable means are to be provided to allow the removal of the compressor and electric motor from each refrigerated container.

6.3.3 Suitable safe access is to be provided to each tier of deck stowed refrigerated containers to allow electrical connection, monitoring and maintenance. The use of fixed platforms, such as lashing bridges, should be proposed where possible.

■ *Section 7*

Water cooler refrigeration units

7.1 Cooling water system

7.1.1 A minimum of two independently operated circulation pumps are to be installed. One of the pumps may be used for other services, such as a general service pump.

7.1.2 The capacity of each pump should be sufficient to supply each container at the required flow rate with an excess capacity of at least 10 per cent. This required flow rate should be obtained from the container manufacturer.

7.1.3 The fresh water system is to provide sufficient flow and even distribution to each container location. This is to be achieved using all possible combinations of fresh water pumps and dedicated refrigerated container cells.

7.1.4 The temperature of the cooling water is to be maintained in accordance with the container manufacturer's recommendations.

7.1.5 Flexible hoses are to be utilised for connecting the water supply and return pipes. The connectors on the ends of the flexible hoses are to be of a type that self-closes on disconnection. Adequate valves are to be provided to allow isolation of each cargo hold sub-circuit in the event of a leak or pipe fracture.

7.1.6 A minimum of two fresh-water to sea-water heat exchangers are to be provided. Each is to be rated at 100 per cent of the required cooling duty at the notation conditions. The second heat exchanger may be a standby or part of a common central system such as that used for main engine cooling duties. The heat exchangers are to be supplied by a minimum of two separate sea-water pumps.

7.1.7 If metal pipes are used, the contents of *Pt 5, Ch 12, 11.8 Metal pipes for fresh water services* are to be given due consideration.

■ *Section 8*

Deck-stowed refrigerated containers

8.1 General

8.1.1 Consideration is to be given to the effect of the warm air discharged from the condenser of each deckstowed refrigerated container. When refrigerated containers are stowed on only two tiers high, it is considered that the warm air from each condenser is dissipated without any undue effect on adjacent containers.

8.1.2 If containers are to be carried three or more tiers high, then consideration is to be given to limiting the effect of short-cycling warm discharge air within the central section of the stack. The proposed method or methods for dealing with this effect are to be stated. Possible options would include reserving the central cells of each stack for non-refrigerated containers, to reduce the block effect or providing fans and ductwork to supply ambient temperature air to the bottom of each vertical stack. Trials of any proposed system are to be undertaken.

8.1.3 Any adverse effect that the warm air discharged from the hold space ventilation system has on the deck stowed refrigerated containers is to be minimised. Similarly, the warm air discharged from the deck stowed refrigerated containers is to be shielded from entering the hold space ventilating system.

■ Section 9

Inspection and testing on completion

9.1 General

9.1.1 On completion of construction and all appropriate safety checks, the acceptance tests prescribed in *Pt 7, Ch 10, 9.2 Acceptance tests* are to be carried out. Their purpose is to verify the correct functioning of the installation and its ability to maintain the air throughput required for the assignment of the intended class notation.

9.1.2 The proposed test schedules, including methods of testing and details of the test equipment to be provided are to be submitted to Lloyd's Register before the tests commence. The proposed test methods are to be appropriate for the design of the system installed and are to include such acceptance criteria as:

- (a) Volume of air to be supplied and/or exhausted at each container cell location.
- (b) Maximum allowable deviation from this air volume.
- (c) Maximum allowable pressure within the hold space when the system is under normal operating conditions.

9.1.3 Trials of the air distribution system within the hold spaces are to be witnessed by Lloyd's Register surveyors before the ship is put into service and prior to the **CRC** notation certificate being issued. These trials are to be in addition to any tests which may have been carried out whilst commissioning the system.

9.2 Acceptance tests

9.2.1 The acceptance tests (*see also Pt 7, Ch 10, 9.2 Acceptance tests 9.2.2 and Pt 7, Ch 10, 9.2 Acceptance tests 9.2.3*) are to comprise the following:

- (a) Control and alarm systems are to be tested to demonstrate that they operate correctly, *see also Pt 6, Ch 1, 2.3 Alarm systems, general requirements*.
- (b) The accuracy, calibration and functioning of all instrumentation is to be verified.
- (c) For supply air systems: Verification of each supply fan's output when running at maximum speed. Verification of the air discharge rate and operation of any distribution arrangements at each individual container cell location. During the test, all supply fans serving the hold space are to be operated simultaneously, thus replicating normal operating conditions. If a common or multiple supply fan distribution system is fitted, then the arrangements are to be verified; firstly, with all supply fans in operation and, secondly, with any one fan out of action.
- (d) For exhaust air systems: Verification of each exhaust fan's output when running at maximum speed. The volume of air being extracted from each individual container cell location is to be verified with each exhaust fan running at maximum speed. All exhaust fans serving the same hold space are to be operated simultaneously thus replicating normal operating conditions.
- (e) For combined supply and exhaust air systems: Verification of each supply and exhaust fan's output when both are running at maximum speed. The volume of air being supplied and extracted from each individual container cell location is to be verified. All fans serving the same hold space are to be operated simultaneously thus replicating normal operating conditions.
- (f) If the supply and/or exhaust ductwork is prefabricated and installed in one piece testing at the manufacturer's works may be accepted provided the following are considered:
 - Any change in the supply and/or exhaust fan(s) output due to differences in electricity supply.
 - Any de-rating of the fan throughput due to a back pressure or partial vacuum occurring within the hold space during normal operating conditions.
 - Verification of the test results is to be undertaken in a single hold space.
- (g) Where the air volume required to meet the class notation cannot be verified during testing for practical reasons, assignment of the notation is to be deferred until it is demonstrated that the system is able to achieve the specified air throughput within each hold space during a loaded passage.

9.2.2 Where a number of identical fan and ductwork installations are constructed and fitted within each hold space, the acceptance trials required in *Pt 7, Ch 10, 9.2 Acceptance tests 9.2.1* need only be carried out in two separate hold spaces, provided that the results are satisfactory.

9.2.3 Where the same system is installed on a number of identical sister ships for the same Owner and by the same shipyard, the testing in accordance with *Pt 7, Ch 10, 9.2 Acceptance tests 9.2.1* will only be required on the first ship of the series, provided that the results are satisfactory.

9.2.4 The effect of exhausting warm hold space ventilation air on the operation of the integral air-cooled condensers of deck stowed containers is to be established under normal operational conditions. The discharge from hold space discharges is to be suitably modified if necessary.

9.3 Testing of cooling water system

9.3.1 Cooling water piping that is welded *in situ* is to be hydraulically strength tested at 1,5 times the design pressure, but in no case less than 0,35 MPa.

9.3.2 A distribution test is to be carried out to ensure that even fresh water distribution to each container as well as sufficient flow is achieved. As the fresh water system may be somewhat complicated, this test should be carried out with care, using all possible combinations of fresh water pumps installed.

9.3.3 If required, the distribution test can be carried out without containers, utilising flexible hoses for connecting the water supply and return pipes together. The return valves should be partly closed or flexible pipe may be crimped to represent the condenser pressure drop. Water flow meters are to be installed at the highest and the lowest container levels to verify equal water flow.

9.3.4 The capacity of each pump should be measured by a flow meter with an accuracy of ± 3 per cent. Alternatively, this capacity could be obtained from the manufacturer's curves if the static pressure difference across a pump under test conditions is measured.

9.3.5 Sea-water pumps and heat exchangers are normally subjected to a functional test only.

■ Section 10 Spare gear

10.1 General

10.1.1 Adequate spares, together with the tools necessary for maintenance or repair of the ventilation systems are to be carried. The spares are to be determined by the Owner according to the design and intended service.

10.1.2 A minimum of one replacement fan, or complete fan impeller and motor assembly for each size fitted is to be carried onboard.

10.1.3 The maintenance of the spares is the responsibility of the Owner.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section

Scope

- 1 General requirements
- 2 Minimum requirements
- 3 Supplementary characters
- 4 Survey requirements

Scope

The goal of this chapter is to provide for the design and construction of ships having a reduced environmental impact during operation compared to ships designed and constructed solely in accordance with the relevant minimum statutory requirements of the MARPOL convention and as such the requirements in this chapter necessarily exceed the relevant minimum statutory requirements of the MARPOL convention.

Section 1

General requirements

1.1 Application

1.1.1 This Chapter contains requirements for the control of operational pollution.

1.1.2 Compliance with this Chapter is optional. An LR classed ship meeting the requirements of this Chapter will be eligible for **ECO** class notation, which will be recorded in the *Register Book*.

1.1.3 Additional requirements may be imposed by the National Administration with which the ship is registered and/or by the Authority within whose territorial jurisdiction it is intended to operate. Where such additional requirements are relevant to the ship, compliance with those Regulations is the responsibility of the Owner. If specifically requested, Lloyd's Register may provide suitable certification or statement of compliance.

1.1.4 Lloyd's Register is to be advised of any matter that relates to the environmental performance of the ship that would affect the assignment of the **ECO** class notation.

1.2 ECO class notation: minimum requirements and additional characters

1.2.1 *Pt 7, Ch 11, 2 Minimum requirements* states the minimum requirements to be met for assignment of the **ECO** notation.

1.2.2 *Pt 7, Ch 11, 3 Supplementary characters* contains additional requirements. Ships complying with these requirements will be eligible for one or more of the following associated supplementary characters, as applicable:

A Anti-fouling coatings.

BIO Bio-fouling.

CRM Cargo residue minimisation.

EAL Environmentally Acceptable Lubricants

EEDI-3 Energy efficiency design index.

EnMS Ship energy efficiency management.

GW Grey water.

IBTS Integrated Bilge Water Treatment System.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 1

NO_x Nitrogen Oxides (NO_x) exhaust emissions.

OW Oily bilge water.

P Protected oil tanks.

R Refrigeration systems.

SOx-EGCS Exhaust Gas Cleaning System

TC Enhanced tank cleaning.

VECS-L, VOC-R Vapour emission control systems (tankers only).

1.3 Transfer of class ships

1.3.1 A ship classed with another IACS class society that transfers to LR class will be eligible for the class notation **ECO(TOC)** if it holds the previous society's environmental class notation at the time of the transfer of class. However, ships with **ECO(TOC)** notation are not eligible for any of the supplementary characters listed in *Pt 7, Ch 11, 1.1 Application 1.1.2*.

1.3.2 To maintain the **ECO(TOC)** notation a ship must implement and maintain the operational procedures listed in *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.4*, as applicable.

1.4 Definitions

1.4.1 The following definitions are applicable:

- **Animal carcasses** means the bodies of any animals that are carried on board as cargo and that die or are euthanised during the voyage.
- **Antifouling Convention** means the International Convention on Control of Harmful Antifouling Systems on Ships. This Convention prohibits the use of organotin anti-fouling systems on ships and was adopted by the International Maritime Organization (IMO) in October 2001.
- **Ballast Water Convention** means the International Convention for the Control and Management of Ships' Ballast Water and Sediments. This international legislation was developed by the IMO to regulate discharges of ballast water and reduce the risk of introducing nonnative species from ships' ballast water.
- **Black water** is the drainage waste from toilets and urinals.
- **Cargo Residues** means the remnants of any cargo which is not covered by other Annexes to MARPOL and which remains on the deck or in holds following loading or unloading, including loading and unloading excess or spillage, whether in wet or dry conditions or entrained in wash water. This does not include cargo dust remaining on the deck after sweeping or dust on the external surfaces of the ship.
- **Cooking oil** means any type of edible oil or animal fat used or intended to be used for the preparation or cooking of food. This does not include the food that is prepared using these oils.
- **Domestic wastes** mean all types of wastes not covered by other Annexes that are generated in the accommodation spaces on board the ship. Domestic waste does not include grey water.
- **Garbage** means all kinds of food wastes, domestic wastes and operational wastes, all plastics, cargo residues, cooking oil, fishing gear, and animal carcasses generated during the normal operation of the ship and is liable to be disposed of continuously or periodically, except where those substances are defined or listed in other Annexes to MARPOL. Garbage does not include fresh fish and parts thereof which are generated as a result of fishing activities undertaken during the voyage, or as a result of aquaculture activities which involve the transport of fish, including shellfish for placement in the aquaculture facility and the transport of harvested fish, including shellfish from such facilities to shore for processing.
- **Geometric mean** means the *n*th root of the product of *n* numbers.
- **Grey water** is drainage from dishwater, galley sink, shower, laundry, bath and washbasin drains and does not include drainage from toilets, urinals, hospitals, and animal spaces, as defined in *Regulation 1 - Definitions* of MARPOL Annex IV and does not include drainage from cargo spaces.
- **Incinerator ashes** means ash and clinkers resulting from shipboard incinerators used for the incineration of garbage.
- **Leakage detection system** means a calibrated mechanical, electrical or electronic device for detecting leakage of refrigerant gases which, on detection, alerts the operator.
- **MARPOL** or **MARPOL 73/78** is the International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978.
- **Operational wastes** means all solid wastes (including slurries) not covered by other Annexes that are collected on board during normal maintenance or operations of a ship, or used for cargo stowage and handling. Operational wastes also include

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 1

cleaning agents and additives contained in the cargo hold and external wash water. Operational wastes do not include grey water, bilge water, or other similar discharges essential to the operation of a ship, taking into account the guidelines developed by the Organisation.

- **Operator** means the natural or legal person exercising actual power over the technical functioning of the equipment and systems.
- **Refrigerant system log book** means a method of maintaining a record of maintenance, calibration, refrigerant charging, leak detection, recovery, etc. The log book may take the form of a stand-alone book, a series of log sheets or form part of the engine room log.
- **SEEMP** means a Ship Energy Efficiency Management Plan, and is a ship-specific manual which aims to improve the energy efficiency of ship operations.
- **Thermotolerant coliforms** is the group of coliform bacteria which produce gas from lactose in 48 hours at 44,5°C. They are also referred to as 'faecal coliforms'; however, the term 'thermotolerant coliforms' is now accepted as more appropriate, since not all of these organisms are of faecal origin.
- **VECS** means vapour emission control system.
- **VOC** means volatile organic compound.

1.5 Information to be submitted

1.5.1 The following are to be submitted for plan approval and document review:

- (a) One copy of every Certificate listed in *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.3*.
- (b) One copy of all plans and information listed in *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.5*.

1.5.2 For existing ships the certificates, information and plans listed in *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.3* are to be submitted for approval prior to the **ECO** Initial Survey for assignment of the **ECO** notation, see *Pt 7, Ch 11, 4.1 Initial Survey and Audit 4.1.1*. For new ships, information and plans listed in *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.3* and *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.5* are to be submitted for approval prior to the **ECO** Initial Survey. However, the operational procedures listed in *Pt 7, Ch 11, 1.5 Information to be submitted 1.5.4* may be submitted up to six months after the ship enters into service.

1.5.3 Certificates:

- (a) MARPOL certificates or statements on behalf of the ship's Flag State, including:
 - Engine International Air Pollution Prevention (EIAPP) Certificate or Statement of Compliance with the NO_x emission requirements of MARPOL *Annex VI - Regulations for the Prevention of Air Pollution from Ships*, for each engine to which *Regulation 13 - Nitrogen Oxides (NO_x)* applies;
 - International Energy Efficiency Certificate.
- (b) Safety Management Certificate (SMC) and Document of Compliance (DOC) in accordance with the International Safety Management Code (ISM Code).
- (c) Incinerator Type Approval Certificate or equivalent.
- (d) TBT-free anti-fouling system certificate.
- (e) Sewage system and, where fitted, sewage treatment system statement of compliance with the requirements of USCG 33 CFR 159 and/or MARPOL *73/78 Annex IV of MARPOL 73/78 Regulations for the Prevention of Pollution by Sewage from Ships*.
- (f) Vapour emission control system certificate or statement of compliance with the requirements of USCG 46 CFR 39 or the IMO Standards for Vapour Emission Control Systems (*MSC/Circular.585 - Standards for Vapour Emission Control Systems - (Adopted on 16 April 1992)*) (oil tankers carrying crude oil only).
- (g) VOC reducing device Type Approval Certificate or equivalent as required by (supplementary character **VOC-R**).
- (h) ISO 50001 (Energy Management) Certificate, issued by an accredited organisation (supplementary character **EnMS** only).

1.5.4 The following operational procedures are to be in place at the time of the on board verification survey:

- (a) Procedures to be adopted to ensure that the ship's NO_x certification is maintained.
- (b) Fuel oil management for the control of SO_x emissions.
- (c) Refrigerant management including adding and recovering refrigerant charge, leak detection and sample log book.
- (d) Retention and disposal of spilled or spent foam, chemical or liquid based fire-fighting media, as applicable.
- (e) Oil pollution prevention measures.
- (f) Garbage management.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 1

- (g) Sewage treatment and discharge control.
- (h) Precautionary measures to minimise the transfer of non-native organisms in ballast water.
- (i) Ballast Water Management Plan (all ships).
- (j) Ship Energy Efficiency Management Plan.
- (k) Vapour management plan (tankers carrying crude oil only).
- (l) Grey water treatment or holding and discharge (supplementary character **GW** only).

1.5.5 Information and plans:

- (a) SERS registration number or statement of membership of alternative scheme from IACS Member service provider.
- (b) Details of engine make and model, rated power, rated speed and duty cycle for all installed engines falling within the scope of MARPOL Annex VI, *Regulation 13 – Nitrogen Oxides (NOx)*.
- (c) Description of the method(s) by which the NOx certified value has been achieved and the NOx Technical File for the engine plus the NOx reducing device (**NOx-3** supplementary character).
- (d) Details and location of each permanently installed refrigeration system (including those used for cargo temperature control, air conditioning, provision rooms and chiller units).
- (e) Details of the Exhaust Gas Cleaning System demonstrating compliance with MARPOL Annex VI Regulations 14.1 and 14.4 are to be provided, including the approved SO_x Emissions Compliance Plan (SECP) and the certified value of SO₂/CO₂ emission ratio, where applicable.
- (f) Mass of refrigerant charge in each system and the refrigerant designation (e.g. R-134a) in accordance with ISO 817.
- (g) Refrigerant plant general arrangement drawing showing number and locations of the refrigerant leak detectors.
- (h) Details of fire-extinguishing media to be used in fixed fire-fighting systems and portable extinguishers.
- (i) Bilge holding, waste oil and sludge tank capacities and piping arrangements.
- (j) Arrangements of non-cargo oil loading and discharge connections together with associated drip trays and drainage systems.
- (k) Fuel oil storage, settling and service tank high level alarms/overflow systems.
- (l) Cargo and ballast tank arrangements (tankers only).
- (m) Cargo and ballast piping system plans, including cargo tank overfill prevention arrangements (tankers only).
- (n) Arrangements of tanker cargo manifolds together with associated drip trays and drainage systems.
- (o) Details of sewage treatment and handling systems.
- (p) Capacity of sewage holding and/or treatment system.
- (q) Maximum numbers of crew and passengers.
- (r) Details of incinerator arrangements, as applicable, associated piping systems, control and monitoring equipment.
- (s) Hull coating system.
- (t) Ballast water treatment arrangements
- (u) Lubricants' technical data sheet(s) and letter/Statement(s) from original equipment manufacturer(s) for each oil-to-sea interface where EAL's are applied (e.g. sterntube) to declare compatibility with the specified Environmentally Acceptable Lubricant(s) and detailed drawings of the component(s) 'interfacing' with such lubricants (supplementary character **EAL** only).
- (v) Energy Efficiency Design Index Statement of Compliance or certificate.
- (w) Details of grey water treatment plant and effluent quality (for supplementary **GW** character only).
- (x) Arrangements for protected oil tanks (for supplementary **P** character only).
- (y) Shadow area diagrams (supplementary character **TC** only).
- (z) Details of self-contained vapour recovery systems, where fitted, required for **VOC-R** character; for tankers carrying crude oil as applicable (see Pt 7, Ch 11, 2.9 VOC management); and for **VECS-L** character as applicable (see Pt 7, Ch 11, 3.15 Vapour emission control systems – VECS-L, VOC-R characters 3.15.3).
- (aa) LR Statement of SEEMP conformance and associated documentation.
- (ab) Any information relating to the environmental performance of the ship, which may influence the assignment of the **ECO** notation.

1.6 Alterations and additions

1.6.1 When an alteration, amendment, deletion or addition to the approved arrangements and procedures is proposed, appropriate details are to be submitted for approval.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 2

■ Section 2 Minimum requirements

2.1 General

2.1.1 It is a prerequisite for assignment of the **ECO** notation that the ship:

- (a) complies with the Anti-fouling Convention, the Ballast Water Convention and all Annexes to *MARPOL - International Convention for the Prevention of Pollution from Ships 73/78*, as amended, applicable to the ship;
- (b) has a valid Safety Management Certificate (SMC), in accordance with the ISM Code issued by the Flag State Administration with which the ship is registered or a duly authorised organisation complying with *IMO Resolution A.739(18) – Guidelines for the Authorization of Organizations Acting on Behalf of the Administration – (Adopted on 4 November 1993) Amended by Resolution MSC.208(81)* and authorised by the National Authority with which the ship is registered; and
- (c) is enrolled in LR's Ship Emergency Response Service (SERS) or the equivalent scheme of another IACS Member.

2.1.2 Where a ship, by virtue of its gross tonnage, is not required by the MARPOL Convention to have MARPOL Certification, the following are to be maintained:

- (a) An Oil Record Book in accordance with *MARPOL Annex I of MARPOL 73/78 Regulations for the Prevention of Pollution by Oil*.
- (b) A garbage management plan and record book in accordance with *MARPOL Revised Annex V of MARPOL 73/78 Regulations for the Prevention of Pollution by Garbage from Ships*.

2.1.3 Where a ship, by virtue of its gross tonnage, is not required by the Antifouling Convention to have certification, an antifouling system (AFS) declaration in the format shown in Appendix 2 of Annex 4 to the Convention is to be maintained on board. The application of antifouling systems containing TBT above the level specified in the Antifouling Convention is prohibited.

2.1.4 Where a ship, by virtue of its gross tonnage, is not required to have a Safety Management Certificate (SMC), it is exempt from *Pt 7, Ch 11, 2.1 General 2.1.2.(b)*.

2.1.5 High speed craft, as defined in LR's *Rules and Regulations for the Classification of Special Service Craft, July 2021*, and ships, other than tankers, of less than 400 gross tonnage, will be the subject of special consideration.

2.1.6 Offshore supply vessels that are less than 100 m in length, as per MSC 235(82), are exempt from the requirement to be enrolled in LR's Ship Emergency Response Service (SERS) or the equivalent scheme of another IACS member. Exempting the requirement for enrolment in SERS, or the equivalent scheme of another IACS member for other vessel types, will be specially considered depending on the vessel's size and operational profile.

2.2 Nitrogen oxides (NO_x)

2.2.1 These requirements apply to all installed diesel engines with an individual output power greater than 130 kW, other than those used solely for emergency purposes on the ship on which the engine is installed. There are no specific requirements relating to NO_x emissions from boilers, incinerators or gas turbine installations.

2.2.2 All engines falling within the scope of MARPOL Annex VI, *Regulation 13 – Nitrogen Oxides (NO_x)* are to comply with its provisions and meet the NO_x emission limits applicable to the date of construction of the ship or, where relevant, the engine installation date.

2.2.3 **EIAPP** certification or Statement of Compliance is to be issued by, or on behalf of, the Flag State.

2.2.4 Alternative arrangements providing an equivalent level of environmental protection will be considered.

2.3 Sulphur oxides (SO_x)

2.3.1 Emissions of SO_x are to be controlled by limiting the sulphur content of fuel oils used on board.

2.3.2 The maximum sulphur content of fuel oil to be used on board is not to exceed 0,5 per cent m/m, unless the ship is equipped with an EGCS meeting the requirements of *Pt 7, Ch 11, 2.3 Sulphur oxides (SO_x) 2.3.6*.

2.3.3 Where the grade of fuel normally used cannot be obtained with the appropriate fuel sulphur level, then a better grade of fuel meeting this requirement will need to be purchased.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 2

2.3.4 A fuel oil management system is to detail the maximum sulphur content to be specified when ordering fuel oils and the means adopted to verify that the sulphur content of fuel oils supplied meets that requirement. This management system is to include the practices to be adopted to ensure that appropriate low sulphur fuel oils are used when the ship is within IMO designated 'Emission Control Areas established for SO_x and particulate matter control' and/or the jurisdiction of other local, national or regional 'SO_x Emission Control regimes' as applicable.

2.3.5 Where testing to determine the sulphur content of fuel received on board is to be carried out, a representative sample is to be drawn at the time of delivery from the ship's bunker manifold using the manual or automatic sampling methods defined in ISO 3170 or 3171, or their national respective equivalents. Fuel sulphur content is to be subsequently determined using the laboratory test method ISO 8754:2003 *Determination of sulphur content – Energy-dispersive X-ray fluorescence spectrometry*.

2.3.6 If an Exhaust Gas Cleaning System is fitted, it is to be certified to *Resolution MEPC.259(68) - 2015 Guidelines for Exhaust Gas Cleaning Systems - (Adopted on 15 May 2015)*. The system is to be able to operate at all times regardless of the area in which the vessel operates.

2.4 Refrigeration systems

2.4.1 These requirements apply to all permanently installed refrigeration and air conditioning installations on board with more than 3 kg of refrigerant. These requirements do not apply to stand-alone refrigerators, freezers and ice makers used in galleys, pantries, bars and crew accommodation.

2.4.2 The use of chlorofluorocarbons (CFC) and hydrochlorofluorocarbons (HCFCs) in existing and new refrigeration or air conditioning installations is prohibited.

2.4.3 Where possible, natural refrigerants, such as ammonia, carbon dioxide and hydrofluoroolefins (HFOs), should be used. Where hydrofluorocarbon (HFC) refrigerants are used, they are to have an Ozone Depleting Potential (ODP) rating of zero and a Global Warming Potential (GWP) of less than 1950, based on a 100- year time horizon.

2.4.4 Systems are to be arranged with suitable means of isolation so that maintenance, servicing or repair work may be undertaken without releasing the refrigerant charge into the atmosphere. Unavoidable minimal releases are acceptable when using recovery units.

2.4.5 For the purposes of refrigerant recovery, the compressors are to be capable of evacuating a system charge into a liquid receiver. Additionally, recovery units are to be provided to evacuate a system either into the existing liquid receiver or into cylinders dedicated for this purpose. The number of cylinders is to be sufficient to contain the complete charge between points of isolation in the system.

2.4.6 Where different refrigerants are in use they are not to be mixed during evacuation of systems.

2.4.7 Refrigerant leakage is to be minimised by leak prevention and periodic leak detection procedures. The frequency of leak detection and the maximum allowable annual leakage rate is dependent on the charge of each system and is specified in *Table 11.2.1 Refrigerant leak testing - maximum periodicity*.

Table 11.2.1 Refrigerant leak testing - maximum periodicity

Charge size	Periodicity	Leakage
3–30 kg	3 months	10%
30–300 kg	Monthly	5%
Over 300 kg	Monthly	<3%

2.4.8 Records are to be maintained demonstrating that leak testing is carried out in accordance with the periodicity specified in *Table 11.2.1 Refrigerant leak testing - maximum periodicity* by qualified personnel holding relevant certification, using either direct or indirect measuring methods and calibrated instruments where applicable.

2.4.9 A leak detection system appropriate to the refrigerant is to be provided to monitor continuously the spaces into which the refrigerant could leak. An alarm is to be activated to give warning in a permanently manned location when the concentration of refrigerant in the space exceeds a predetermined limit, (25 ppm for ammonia; 300 ppm for halogenated fluorocarbons). Remedial measures to repair the leakage are to be implemented as soon as practicable after an alarm is activated. Each leak detection system is to be checked at least once every 12 months to ensure proper functionality. The system is to be maintained and calibrated in accordance with the manufacturer's recommendations and recorded in the log book.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 2

2.4.10 Procedures for refrigerant management including adding and recovering refrigerant charge, leak detection and the means adopted to control the loss and leakage of refrigerants are to be established and implemented.

2.4.11 Refrigerant inventory and log book records are to be maintained covering:

- (a) Refrigerant added to each system.
- (b) Refrigerant leaks, including remedial actions.
- (c) Refrigerant recovered and storage location.
- (d) Refrigerant disposal including quantity and location.
- (e) Details of personnel suitably experienced or with an applicable qualification for maintenance of the onboard refrigerant system(s), including relevant certification.

2.4.12 After a leak has been identified, repaired and recorded it is to be rechecked prior to the system entering normal service. All applications, independent of charge size, are to be checked for leakage within one month after a leak has been repaired to ensure that the repair remains effective.

2.4.13 Records demonstrating the implementation of the operational procedures specified in *Pt 7, Ch 11, 2.4 Refrigeration systems 2.4.10*, as applicable, are to be maintained. These records are to be kept on board for a minimum period of three years, in a readily accessible form, and are to be available for inspection by LR Surveyors, as required.

2.4.14 A refrigerant log book is to be maintained for the lifetime of the system. It must record the quantity and type of refrigerant installed and the quantities added and recovered during servicing, maintenance and final disposal.

2.4.15 All personnel involved in the following activities must be suitably experienced or possess an applicable qualification:

- (a) installation, servicing or maintenance of the refrigeration equipment covered by the **ECO** Notation;
- (b) checking such equipment for any leakages of refrigerant gases; or
- (c) repairing, or carrying out work to prevent, such leakages.

2.4.16 **Flammability of Refrigerants** - The Refrigerant Classification Scheme, ISO 817:2014+A1:2017, is to be considered regarding the flammability class of the refrigerant. Where A2L and higher refrigerants are to be used in systems they are to be designed specifically to take into account their flammability and toxicity characteristics. These refrigerants may not replace non-flammable refrigerants when retrofitting a system.

(a) Where refrigerants are classed as A2L and higher, *Pt 7, Ch 11, 2.4 Refrigeration systems 2.4.4 to Pt 7, Ch 11, 2.4 Refrigeration systems 2.4.15* are applicable with the following additional requirements:

- Spaces are to be fitted with a non sparking mechanical ventilation system, with a capacity of at least 30 air changes per hour, which is arranged to avoid areas where gas may accumulate, taking into account the density of the vapour and potential ignition sources. The ventilation system shall be separated from those serving other spaces.
- All leak detection equipment shall be suitable to use in a hazardous area and means are to be provided to measure oxygen levels prior to personnel entering the space.
- The leak detection is to be set to alarm at gas concentrations above 30% lower flammable limit (LFL),
- A risk assessment reviewing the application, location of components and the installed refrigerant charge.
- All personnel carrying out maintenance, inspections, servicing and installation must hold an appropriate certificate for handling such refrigerants
- All spaces containing these refrigerants are to be indicated on a hazardous area plan.

2.5 Fire-fighting systems

2.5.1 The use of halon or halo-carbons as the fire-extinguishing medium in fixed fire-fighting systems or portable extinguishers is not permitted.

2.5.2 Where foam concentrates or other chemical or liquid based fire-fighting media with the potential to cause environmental pollution are used, instructions and procedures are to be provided for the safe containment and disposal of spilled media and other contaminated products during routine maintenance and, where practicable, following emergency use.

2.6 Oil pollution prevention

2.6.1 All ships are to comply with the requirements of *Pt 7, Ch 11, 2.6 Oil pollution prevention 2.6.2 to Pt 7, Ch 11, 2.6 Oil pollution prevention 2.6.12*. In addition, tankers are to comply with the requirements of *Pt 7, Ch 11, 2.7 Arrangements on ships carrying oil cargoes in bulk*.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 2

2.6.2 Drainage from machinery space bilges is to be discharged to sea in accordance with the requirements of MARPOL 73/78, *Annex I of MARPOL 73/78 Regulations for the Prevention of Pollution by Oil* or retained onboard for discharge ashore.

2.6.3 The oil-in-water content of the water discharged is to be less than 15 ppm. Oily bilge water is to be discharged through approved oil filtering equipment and a 15 ppm alarm combined with a device for automatically stopping any discharge to sea when the oil content in the discharge exceeds 15 ppm. Full records of all discharges are to be kept.

2.6.4 The loading or discharge connections and vent pipes/overflows associated with fuel oils, lubricating oils, hydraulic oils and other oils are to be fitted with drip trays. Drip trays fitted to loading or discharge connections are to be fitted with closed drainage systems except on tankers where alternative arrangements will be considered.

2.6.5 Fuel oil storage, settling and service tanks are to be fitted with high level alarms and/or acceptable overflow systems.

2.6.6 The tank arrangement and engine room management procedures are to ensure that any leakages and waste oil from machinery and equipment are collected prior to disposal ashore or incineration. At all times, there is to be sufficient capacity to store a complete lubricating oil charge from the largest engine used for propulsion or electrical generating purposes. The tank arrangement is to allow the lubricating oil charge subsequently to be renovated or to be discharged ashore.

2.6.7 For those ships which only operate on distillate fuel, the tank arrangements in *Pt 7, Ch 11, 2.6 Oil pollution prevention 2.6.6* and sludge tanks may be combined to form a single tank. Where such a combined tank is fitted, the total capacity is to be equal to or greater than the aggregated total of the required individual tank capacities.

2.6.8 The bilge holding tank, the tank arrangements in *Pt 7, Ch 11, 2.6 Oil pollution prevention 2.6.6* and the sludge tank are to be arranged to facilitate the periodic removal of accumulated sediments and other material.

2.6.9 Discharge piping systems to deck from the bilge holding tank, and the tank arrangements in *Pt 7, Ch 11, 2.6 Oil pollution prevention 2.6.6*, are to be separate from the fuel oil loading and transfer systems. Their piping systems are to be terminated with the standard discharge connections specified in MARPOL Annex I, *Regulation 13*.

2.6.10 Means are to be provided for the collection and recovery of any oil spilled on decks.

2.6.11 For ships delivered after 1 August 2010, fuel oil tanks with a capacity of greater than 60 m³, except overflow tanks, are to be located in a protected location away from the ship's side or bottom shell plating. Tanks are to be located in accordance with the requirements relating to fuel oil tank protection given in MARPOL Annex I, *Regulation 12A*.

2.6.12 Procedures covering the handling of all oils and oily wastes are to be established and implemented. As a minimum, these are to cover:

- (a) loading, storage and transfer of fuel oils, lubricants, hydraulic oil, thermal heating oil and drummed oil products;
- (b) storage, transfer, discharge and disposal of oily mixtures contained in the ship's sludge, bilge holding and waste oil tanks and machinery space bilges;
- (c) recovery of any oil spilled on decks.

2.7 Arrangements on ships carrying oil cargoes in bulk

2.7.1 The constructional requirements of MARPOL Annex I, *Regulations 19 and 20*, as applicable, are to apply to all oil tankers greater than 600 tonnes deadweight.

2.7.2 Cargo tanks are to be fitted with high level alarms and/or acceptable overflow systems.

2.7.3 The cargo area is to have arrangements to collect accidental outflow of oil under overfilling conditions. Accidental oil spills are to be discharged to a slop tank or collecting tank. These tanks are not to be located in the double hull space.

2.7.4 Cargo tank ballasting arrangements and segregated ballast systems are to be connected to separate and distinct sea chests.

2.7.5 A non-return valve is to be provided to isolate the cargo piping system from the sea connections.

2.7.6 Cargo manifold connections are to be fitted with drip trays with closed drainage systems.

2.7.7 Cargo manifold terminal pieces are to be designed, where practicable, in accordance with the relevant Oil Companies International Marine Forum (OCIMF) Recommendations for tanker manifolds and associated equipment.

2.7.8 Procedures covering ship to ship transfer of bulk liquid cargoes are to be established for ships engaged in the transfer of oil cargo at sea (STS Operations as defined in MARPOL Annex 1 Ch 8 *Regulation 40 – Scope of application, Regulation 41 – General Rules on safety and environmental protection and Regulation 42 – Notification*). These are to be agreed with LR, and implemented.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 2

2.8 Sewage treatment

2.8.1 Where fitted, the sewage treatment system is to be approved in accordance with *Resolution MEPC.284.(70) - Amendments to the 2012 Guidelines on implementation of Effluent Standards and Performance Tests for Sewage Treatment Plants (Resolution MEPC.227(64)) - (Adopted on 28 October 2016)*. As an alternative, a Declaration of Conformity issued under the EU Marine Equipment Directive is acceptable.

2.8.2 The capacity of the sewage treatment system is to be sufficient for the maximum number of persons on board. Treatment capacities are to be as stated in *Table 11.2.2 Sewage system treatment capacity*.

Table 11.2.2 Sewage system treatment capacity

	Total treatment capacity in litres/person/day		
	Black water only treated	Black water and grey water treated	
		Cargo ships	Passenger ships
Conventional flushing system	115	250	415
Vacuum flushing system	15	150	315

2.8.3 Procedures for the operation of a sewage treatment system, including the certification of performance, are to be established and implemented. Records are to be maintained of maintenance, repair, remedial work and disinfectant dosing rates.

2.8.4 The manufacturer's restriction on materials, which may be disposed of through the sewage treatment system, are to be clearly displayed at each input point.

2.8.5 The disinfectant dosing points of the sewage treatment system are to be readily accessible. Ready access is also to be provided for the taking of samples.

2.8.6 As an alternative to treatment, sewage and/or grey water may be retained on board. The sewage holding tank(s) and grey water holding tank(s) are to be of adequate capacity, taking into account the operation of the ship, the number of persons on board and other relevant factors (see guidance figures in *Pt 7, Ch 11, 2.8 Sewage treatment 2.8.2*). The tank is to be fitted with a visual contents gauge and a high level alarm.

2.8.7 Means are to be provided to aerate holding tanks to prevent the development of anaerobic conditions, taking into account *MSC/Circular.648 – Guidelines for the Operation, Inspection and Maintenance of Ship Sewage Systems – (Adopted on 6 June 1994)*.

2.8.8 Records are to be maintained detailing discharges from the holding tank. These are to include:

- the date, location and quantity of sewage discharged from the holding tank either ashore or at sea in accordance with *Resolution MEPC.157(55) - Recommendation on Standards for the Rate of Discharge of Untreated Sewage from Ships - (Adopted on 13 October 2006)*;
- rate of discharge of raw sewage;
- distance from land and ship's speed, when sewage is discharged to sea.

2.8.9 Ventilation pipes from the sewage system are to be independent of other vent systems.

2.8.10 A suitable piping system from the sewage treatment system or holding tank is to be provided to allow discharge from the system/tank to shore reception facilities. The systems discharge pipe is to terminate with a standard discharge connection complying with the requirements of MARPOL Annex IV, *Regulation 10 - Standard Discharge Connections*.

2.8.11 Procedures for the cleaning and safe entry of sewage treatment systems and holding tanks, including the use of suitable personal protective equipment, are to be provided and implemented.

2.9 VOC management

2.9.1 Tankers carrying crude oil are required to develop and implement a VOC Management Plan in accordance with IMO Guidelines for the Development of a Volatile Organic Compound (VOC) Management Plan for tankers carrying crude oil (*Resolution MEPC.185(59) – Guidelines for the Development of A VOC Management Plan – (Adopted on 17 July 2009)*) that has been approved by LR or by, or on behalf of, the ship's Flag State.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 3

2.9.2 For all tankers carrying crude oil, a Vapour Emission Control System is to be fitted which has been designed and constructed in accordance with the requirements of USCG 46, CFR 39 or the IMO Standards for Vapour Emission Control Systems (*MSC/Circular.585 – Standards for Vapour Emission Control Systems – (Adopted on 16 April 1992)*). A Certificate or Statement of Compliance issued by LR or a competent Authority recognised by LR is to be provided. As an alternative, a self-contained Vapour Recovery System, which is of a type approved by LR and which achieves equivalent performance to the systems above, may be fitted.

■ Section 3 Supplementary characters

3.1 Hull anti-fouling systems – A character

3.1.1 For assignment of the **A** character, the anti-fouling system applied to the ship's hull is to be listed as biocide-free in the Lloyd's Register List of Approved Products.

3.2 Bio-fouling – BIO character

3.2.1 For the assignment of the BIO character, the ship is to have in place bio-fouling management plans, developed in accordance with IMO Resolution MEPC.207(62) – 2011 Guidelines for the Control and Management of Ships' Biofouling to minimize the transfer of invasive Aquatic Species – (Adopted on 15 July 2011). In addition, the Bio-fouling Management Plan is to be reviewed by LR for conformance with Resolution MEPC.207(62) – 2011 Guidelines for the Control and Management of Ships' Biofouling to minimize the transfer of invasive Aquatic Species – (Adopted on 15 July 2011).

3.2.2 The ship is also to have on board a Bio-fouling Record Book in the format shown in *Appendix 2 - Biofouling Management Plan and Record book of Resolution MEPC.207(62) – 2011 Guidelines for the Control and Management of Ships' Biofouling to minimize the transfer of invasive Aquatic Species – (Adopted on 15 July 2011)* that contains at least the following:

- Details of the anti-fouling systems and operational practices used (where appropriate, as recorded in the Anti-fouling System Certificate), where and when it was installed, areas of the ship that are coated, its maintenance and, where applicable, its operation; dates and location of dry-dockings/slippings, including the date the ship was refloated, and any measures taken to remove bio-fouling or to renew or repair the anti-fouling system;
- The date and location of in-water inspections, the results of those inspections and any corrective action taken to deal with observed bio-fouling;
- The dates and details of inspection and maintenance of internal sea-water cooling systems, the results of those inspections, and any corrective action taken to deal with observed bio-fouling and any reported blockages; and
- Details of when the ship has been operating outside its normal operating profile, including any details of when the ship was laid-up or inactive for extended periods of time.

3.3 Cargo residue minimisation – CRM character

3.3.1 For assignment of the **CRM** character, cargo residue is to be minimised.

3.3.2 In accordance with MARPOL Annex II, *Regulation 12 - Pumping, piping, unloading arrangements and slop tanks*, individual cargo tanks are not to retain more than 60 litres of residue in the tank and associated piping.

3.3.3 A performance test is to be conducted in accordance with *Appendix 5 - Assessment of Residue Quantities in Cargo Tanks, Pumps and Associated Piping* of MARPOL Annex II and a record of the test results retained on board.

3.4 Environmentally Acceptable Lubricants - EAL character

3.4.1 For assignment of the **EAL** character, the ship shall use Environmentally Acceptable Lubricants (EAL) that comply with the EPA criteria, as defined in Section 2.2.9 of the 2013 Vessel General Permit (VGP).

3.4.2 Ships shall have on board a 'Report of Environmentally Acceptable Lubricants' and a Statement of Fact issued by LR or equivalent documentation issued by another IACS member.

3.4.3 All the planned actions mentioned in the relevant Sections of the Report shall be completed, as appropriate, for the assignment of the supplementary character.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 3

3.5 Energy Efficiency Design Index – EEDI-3 characters

3.5.1 The ‘attained’ Energy Efficiency Design Index is to be established in accordance with the 2012 Guidelines on the method of calculation of attained EEDI for new ships (*Resolution MEPC.203(62) – Amendments to the Annex of the Protocol of 1997 to Amend the International Convention for the Prevention of Pollution from Ships...*) and verified in accordance with LR’s procedure for verifying EEDI values.

3.5.2 The **EEDI-3** character will be assigned to ‘new ships’ (according to MARPOL Annex VI, Chapter 1, *Regulation 2 - Definitions*) to which EEDI Phase 0, Phase 1 or Phase 2 is applicable when the ‘attained’ EEDI is less than or equal to the EEDI Phase 3 requirement.

3.6 Energy management – EnMS character

3.6.1 For the assignment of the **EnMS** character, certification under ISO 50001 (Energy Management) is to be issued by an accredited organisation and is to be applicable to the management and operation of the ship.

3.7 Integrated bilge water treatment system – IBTS character

3.7.1 These requirements apply to ships with an integrated bilge water system.

3.7.2 For assignment of the **IBTS** character, the ship is to have an integrated bilge water system designed and installed to meet the requirements of the *Revised Guidelines for Systems for Handling Oily Wastes in Machinery Spaces of Ships* and incorporating *MEPC.1/Circular.642 – 2008 Revised Guidelines for Systems for Handling Oily Wastes in Machinery Spaces of Ships Incorporating Guidance Notes for an Integrated Bilge Water Treatment System (IBTS)...* & *MEPC.1/Circular.643 – Harmonized Implementation of the Revised Guidelines and Specifications for Pollution Prevention Equipment for Machinery Space Bilges of Ships During the Type-Approval Process – (12 November 2008)* as amended by *MEPC.1/Circular.676 – Amendment to the 2008 Revised Guidelines for Systems for Handling Oily Wastes in Machinery Spaces of Ships Incorporating Guidance Notes for an Integrated Bilge Water Treatment System (IBTS) – (31 July 2009)* & *MEPC.1/Circular.760 – Amendments to the 2008 Revised Guidelines for Systems for Handling Oily Wastes in Machinery Spaces of Ships Incorporating Guidance Notes for an IBTS (MEPC.1/Circ.642, as Amended by MEPC.1/Circ.676) – (25 August 2011)*.

3.7.3 Ships are to have on board a Statement of Fact on Installation of an Integrated Bilge Water Treatment System (IBTS), issued by LR.

3.8 Grey water – GW character

3.8.1 For assignment of the **GW** character a dedicated plant for the treatment of grey water is to be installed, and the plant discharge effluent is to meet the standards specified in *Pt 7, Ch 11, 3.8 Grey water – GW character 3.8.2* or *Pt 7, Ch 11, 3.8 Grey water – GW character 3.8.3*, as applicable. The **GW** character will also be assigned where grey water is retained on board in dedicated holding tank(s) for discharge ashore, subject to the requirements specified in *Pt 7, Ch 11, 3.8 Grey water – GW character 3.8.4* to *Pt 7, Ch 11, 3.8 Grey water – GW character 3.8.9* being met.

3.8.2 Where it is not intended that the effluent is recycled or re-used for any purpose, the effluent of the grey water treatment plant is to meet the following standards:

(a) Thermotolerant coliforms:

The geometric mean of the thermotolerant coliform count of samples of effluent taken during a test period is not to exceed 100 thermotolerant coliforms/100 ml as determined by membrane filter, multiple tube fermentation or an equivalent analytical procedure.

(b) Total Suspended solids:

- Where the equipment is tested onshore, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed 35 mg/l.
- Where the equipment is tested on board the ship, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed the suspended solids content of the ambient (flushing) water used on board plus 35 mg/l.
- The method of testing is to be as given in *Resolution MEPC.227(64) – 2012 Guidelines on Implementation of Effluent Standards and Performance Tests for Sewage Treatment Plants – (Adopted on 5 October 2012)*.

(c) Biochemical Oxygen Demand (BOD₅) and chemical oxygen demand (COD):

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 3

- The geometric mean of a 5-day Biochemical Oxygen Demand (BOD₅) is not to exceed 25 mg/l. The chemical oxygen demand (COD) is not to exceed 125 mg/l. Test methods are to be ISO 15705:2002 for COD and ISO 5815-1:2003 for carbonaceous BOD₅ or other internationally accepted equivalent test standards.
- (d) pH: The pH of the samples of effluent taken during the test period is to be between 6 and 8,5.
- (e) Zero or non-detected values: For thermotolerant coliforms, zero values are to be replaced with a value of 1 thermotolerant coliform/100 ml to allow the calculation of the geometric mean. For total suspended solids, BOD₅ and COD values below the limit of detection are to be replaced with one half the limit of detection to allow the calculation of the geometric mean.

3.8.3 Where it is intended that the effluent of the grey water treatment plant is to be re-used or recycled for any purpose, the effluent is to meet the potable water quality standards of the Flag or Port State Administration, as appropriate.

3.8.4 As an alternative to treatment, where grey water is retained on board in dedicated holding tank(s) for discharge ashore an additional allowance of 135 litres per person per day is to be made in the capacity of the holding tanks. Each tank is to be fitted with a means to open the tank, means to verify visually the contents of the tank and a high level alarm. Each tank is to be fitted with a means to open the tank, means to verify visually the contents of the tank and a high level alarm. See *Pt 7, Ch 11, 2.8 Sewage treatment 2.8.2*.

3.8.5 Where grey water is retained on board in dedicated holding tanks, means are to be provided to aerate the tanks to prevent the development of anaerobic conditions, taking into account *MSC/Circular.648 – Guidelines for the Operation, Inspection and Maintenance of Ship Sewage Systems – (Adopted on 6 June 1994)*.

3.8.6 Ventilation pipes from the grey water treatment system and, where provided, from holding tank(s) are to be independent of other ventilation systems.

3.8.7 A suitable piping system from the grey water treatment system or holding tank(s) is to be provided to allow discharge to shore reception facilities. The discharge pipe is to terminate with a standard discharge connection complying with the requirements of MARPOL Annex IV, *Regulation 10 - Standard Discharge Connections*. Any connection from the grey water system to the sewage discharge is to be via a screw down non-return valve.

3.8.8 Records of grey water treatment and/or discharge are to be maintained. A single record book may be utilised for both grey water and sewage records. Records detailing discharges from the holding tank(s) are to include:

- (a) the date, location and quantity of grey water discharged from the holding tank(s) either ashore or at sea;
- (b) rate of discharge of untreated grey water;
- (c) distance from land and ship's speed, when untreated grey water is discharged to sea.

3.8.9 Procedures for the cleaning and safe entry of grey water treatment systems and holding tanks, including the use of suitable personal protective equipment, are to be provided and implemented.

3.9 Nitrogen oxides NO_{x3} characters

3.9.1 For assignment of the **NO_{x3}** character, engines and any associated NO_x emission abatement systems are to be certified as meeting the Tier III NO_x emission limits specified in MARPOL Annex VI, *Regulation 13 – Nitrogen Oxides (NO_x)*.

3.9.2 Equipment and systems used to control NO_x emission levels are to:

- (a) be arranged so that failure will not prevent continued safe operation of the engine;
- (b) be operated in accordance with manufacturer's instructions;
- (c) be designed, constructed and installed to ensure structure integrity and freedom from significant vibration;
- (d) be designed to include adequate hatches for inspection and maintenance purposes; and
- (e) be instrumented to record operation. Records of operation and the degree of control are to be maintained.

Alternative control arrangements will be given special consideration.

3.9.3 Procedures covering the use and maintenance of the equipment and systems used to control NO_x are to be established and implemented. Records are to be maintained which demonstrate the operation of the equipment and systems and the resultant level of NO_x emissions to the atmosphere.

3.9.4 Where engines constructed before 1 January 2000 are not certified in accordance with MARPOL Annex VI - *Regulations for the Prevention of Air Pollution from Ships*, the test procedure and measurement method are to be in accordance with either the Simplified Measurement Method or Direct Measurement and Monitoring Method given in Chapter 6 of the IMO *NO_x Technical Code (2008) - Technical Code on Control of Emission of Nitrogen Oxides from Marine Diesel Engines*.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 3

3.9.5 Where engines are constructed on or after 1 January 2000, the NO_x emission value is to be established in accordance with the *NO_x Technical Code - Technical Code on Control of Emission of Nitrous Oxides from Marine Diesel Engines*.

3.9.6 In the case where the individual engines are 'family' or 'group' engines, as defined in the NO_x Technical Code, the respective certified emission value is to be taken as that of the relevant Parent Engine.

3.10 Oily bilge water– OW character

3.10.1 For assignment of the **OW** character, all drainage from machinery space bilges is to be discharged ashore, except under exceptional circumstances.

3.10.2 Adequate capacity for storage of oily bilge water between discharges ashore is to be provided.

3.10.3 Alternatively, discharge to sea is permitted where it can be demonstrated that the oil-in-water content of the water discharged is less than 5 ppm.

3.10.4 The bilge alarm, set at 5 ppm, is to be recalibrated or retested every five years by the manufacturer or other acceptable alternative and full records of the recalibration or retesting are to be kept on board.

3.10.5 Full records of all discharges are to be kept.

3.11 Protected oil tanks – P character

3.11.1 For assignment of the **P** character, in addition to compliance with the requirements of *Pt 7, Ch 11, 2.6 Oil pollution prevention 2.6.11*, all fuel oil, lubricating oil tanks and hydraulic oil are to be located in a protected location away from the ship's side or bottom shell plating.

3.11.2 All fuel oil, lubricating oil and hydraulic oil tanks, with a capacity greater than 60 m³, are to be located in accordance with the requirements relating to fuel oil tank protection given in MARPOL Annex I, *Regulation 12A*, paragraphs 6, 7 and 8. Where tanks cannot be located in such locations the vessel is to comply with the accidental fuel oil outflow performance standard, as specified in paragraph 11 of MARPOL, Annex I, *Regulation 12A*.

3.11.3 Main engine lubricating oil drain tanks and fuel overflow tanks are excluded.

3.11.4 Arrangements providing equivalent protection will be given special consideration.

3.11.5 Suction wells may protrude below fuel oil tanks provided they are as small as possible and the distance between the tank bottom and the ship's bottom shell plating is not reduced by more than 50 per cent.

3.12 Refrigeration systems – R character

3.12.1 For assignment of the **R** character, natural substances are to be used as the refrigerants in all main refrigeration systems such as cargo systems, provision rooms and air conditioning.

3.12.2 Small factory-built refrigeration system(s) that use fluorinated refrigerants, having a Global Warming Potential (GWP) of less than 1950 are allowable.

3.12.3 The GWP value is based on the 100-year time horizon.

3.13 Sulphur oxides – Exhaust Gas Cleaning System SO_x-EGCS character

3.13.1 Where Exhaust Gas Cleaning Systems (EGCS) discharge liquid effluents overboard, the Guidelines on EGCS in section 10 *Washwater of Resolution MEPC.259(68) - 2015 Guidelines for Exhaust Gas Cleaning Systems - (Adopted on 15 May 2015)* are to be followed.

3.14 Enhanced tank cleaning – TC character

3.14.1 For the assignment of the **TC** character, oil and chemical tankers are to be provided with tank washing equipment meeting the standards specified in *Pt 7, Ch 11, 3.14 Enhanced tank cleaning – TC character 3.14.2 to Pt 7, Ch 11, 3.14 Enhanced tank cleaning – TC character 3.14.8*.

3.14.2 Cargo tanks are to be served by individual pumps.

3.14.3 Permanent tank washing machines shall be type approved in accordance with the revised *IMO Resolution A.446(XI) – Revised specifications for the design, operation and control of crude oil washing systems – (Adopted on 15 November 1979)*, and their method of support is to be acceptable to LR.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 4

3.14.4 At the design stage the following minimum procedures are to be used to determine the area of the tank surface covered by direct impingement (longitudinals, brackets, stiffeners, ladders, pipework, corrugations on corrugated bulkheads and face plates can be ignored):

- (a) using suitable structural plans, lines are set out from the tips of each machine to those parts of the tank within the range of the jets; or
- (b) a pinpoint of light simulating the tip of the tank washing machine in a scale model of the tank are to be used.

Alternative methods of measurement will be considered.

3.14.5 Additional tank washing equipment, which may be portable, is also to be provided to enable washing of the shadow areas without the necessity to enter the tanks. The use of portable machines to wash the shadow areas is not to be undertaken where the last cargo in the tank has toxic or low ignition properties, reacts with water or has other properties specified in chapter 15 of the *IBC Code - International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk* amended by Resolution MEPC.225(64) which would prevent water washing or opening of the tank to allow the use of portable washing machines.

3.14.6 A back-up system to provide cleaning capability in the event of failure of one tank washing machine is to be provided.

3.14.7 Heating equipment is to be provided for a tank washing medium which achieves a minimum temperature of 85°C at the connection to the tank washing machine.

3.14.8 The effectiveness of the tank washing system is to be confirmed by tank inspections or other means as required by LR. The confirmation is to be carried out when the ship is in service. For ships fitted with crude oil washing system(s) the confirmation will be carried out as part of the MARPOL Annex I of MARPOL 73/78 Regulations for the Prevention of Pollution by Oil survey and need not be carried out separately.

3.15 Vapour emission control systems – VECS-L, VOC-R characters

3.15.1 Tankers carrying crude oil, petroleum products or chemicals having a flash point not exceeding 60°C (closed-cup test) will be assigned the **VECS-L, VOC-R** character(s) provided the requirements of Pt 7, Ch 11, 3.15 Vapour emission control systems – VECS-L, VOC-R characters 3.15.2 and/or Pt 7, Ch 11, 3.15 Vapour emission control systems – VECS-L, VOC-R characters 3.15.3 respectively are complied with, as applicable.

3.15.2 For assignment of the **VECS-L** character, a vapour emission control system is to be fitted, as specified in Pt 1, Ch 2, 2.8 Descriptive notes, and designed and constructed to meet the requirements for vapour balancing in accordance with USCG 46, CFR 39.40 for service vessels.

3.15.3 For assignment of the **VOC-R** character, a self-contained system capable of preventing vapour emission formation during loading is to be fitted. This vapour emission prevention system is to be of a type approved by LR and is to reduce vapour emission formation by at least 75 per cent (v/v) as compared to an equivalent ship to which no vapour emissions prevention system has been fitted.

■ Section 4 Survey requirements

4.1 Initial Survey and Audit

4.1.1 Following satisfactory review of the plans and other information submitted (see Pt 7, Ch 11, 1.5 Information to be submitted), an **ECO** Initial Survey is to be undertaken for ships under construction or in service.

4.1.2 At the **ECO** Initial Survey, the Surveyor is to be satisfied that the requirements of these Rules, including those relating to any requested supplementary characters, are complied with. The Surveyor is to verify that the hull and machinery arrangements are in accordance with the approved documentation. The installed equipment, together with associated control and alarm systems, is to be demonstrated under working conditions.

4.1.3 Following the successful completion of the Initial Survey, the **ECO** notation may be assigned to a ship. The **ECO** notation will be valid, in the first instance until the first **ECO** Annual Survey. At the first Annual Survey, an audit of the operational procedures as required by these Rules is to be undertaken. Prior to the LR audit, the operational procedures must have been fully implemented and audited by the Operator and the applicable record books must contain in-service records for a period of at least 3 months.

Arrangements and Equipment for Environmental Protection (ECO Class Notation)

Part 7, Chapter 11

Section 4

4.1.4 Audits are to confirm by direct observation, examination of internal audit reports and scrutiny of records that each of the procedures has been implemented over the preceding period. It is also to be verified that:

- (a) the required resources and equipment have been provided; and
- (b) the ship's staff are aware of their duties and responsibilities, and can perform the assigned tasks.

4.2 Periodical Surveys and Audits

4.2.1 **ECO** Annual Surveys and Audits are to be held on all ships to which the **ECO** notation applies within three months of each anniversary for assignment of the full **ECO** notation.

4.2.2 At the **ECO** Annual Survey and Audit, the Surveyor is to be satisfied that the arrangements and equipment comply with these Rules and operating procedures have been implemented. As far as possible, the installed equipment, together with associated control and alarm systems, are to be demonstrated under working conditions. Additionally:

- (a) where changes to arrangements or equipment fitted to meet the requirements of these Rules have been made, it is to be verified that these changes are in accordance with approved documentation; and
- (b) records for the preceding 12 months are to be reviewed.

4.2.3 **ECO** Audits are to be undertaken in accordance with the requirements given in *Pt 7, Ch 11, 4.1 Initial Survey and Audit 4.1.4*.

4.2.4 Where the periodical surveys and audits are not completed in accordance with *Pt 7, Ch 11, 4.2 Periodical Surveys and Audits 4.2.1*, the **ECO** Notation will be suspended. Re-instatement will be subject to surveys being held appropriate to the age of the ship and the circumstances of the case.

4.2.5 Where the periodical surveys and audits identify non-conformances, the **ECO** notation will be suspended. Re-instatement will be as directed by the Classification Committee, appropriate to the circumstances of the case.

4.3 Change of company

4.3.1 Where the company (as defined in the ISM Code) changes, the **ECO** notation will be suspended.

4.3.2 The new company may adopt the existing approved procedures as required by these Rules or may compile new procedures.

4.3.3 Following implementation of the procedures, an audit, in accordance with the requirements in *Pt 7, Ch 11, 4.1 Initial Survey and Audit 4.1.3* and *Pt 7, Ch 11, 4.1 Initial Survey and Audit 4.1.4*, is to be undertaken.

4.3.4 The **ECO** notation will be re-assigned following successful completion of the audit provided that the ship has a valid Safety Management Certificate (SMC) and the general requirements given in *Pt 7, Ch 11, 2.1 General 2.1.1* are complied with.

■ Section 1

General requirements

1.1 Scope

1.1.1 These Rules set down the criteria for the assessment of the noise and vibration on ships and are applied in addition to the other relevant requirements of the *Rules and Regulations for the Classification of Ships* (hereinafter referred to as the Rules for Ships).

1.1.2 The requirements of this chapter may be applied where no other statutory requirements exist.

1.1.3 These Rules provide for two alternatives:

- (a) **Class Notations** which indicate that the ship has been assessed and complies with noise and vibration criteria in these Rules and that a periodic survey regime has been established for the lifetime of the ship.
- (b) **Certificate of Compliance** which provides evidence that the ship has been assessed and found to comply with the noise and vibration criteria in these Rules.

1.1.4 Spaces that comply with the noise level limits specified in *Table 12.2.4 Crew work areas - maximum noise levels in dB(A)* and under Acceptance Numeral 3 in *Table 12.2.1 Passenger ships - Maximum noise levels in dB(A)* and *Table 12.2.3 Crew accommodation - Maximum noise levels in dB(A)*, will meet the requirements of section 4 of IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91), when measured in accordance with the requirements of Chapters 2 and 3 of that Resolution.

1.1.5 Spaces that comply with the noise level limits specified under Acceptance Numerals 1 and 2 in *Table 12.2.1 Passenger ships - Maximum noise levels in dB(A)* and *Table 12.2.3 Crew accommodation - Maximum noise levels in dB(A)*, will achieve enhanced levels of passenger and crew comfort as applicable, when measured in accordance with the requirements of Chapters 2 and 3 of IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91). All vessels can apply for Acceptance Numerals 1 and 2.

1.1.6 These Rules recognise existing National and International Standards and specify levels of noise and vibration currently achievable using good engineering practice. Compliance with these requirements will be assessed by review of procedures, inspection and measurement of the relevant parameters and pre-survey reviews. Inspections and measurements are to be conducted, witnessed or assessed by LR's Surveyors unless otherwise agreed by Lloyd's Register (hereinafter referred to as LR).

1.1.7 Accommodation comfort is a function of ship type and layout. These Rules address two types of ship:

- (a) Passenger (e.g. cruise ships, ro-ro ferries).
- (b) Cargo (e.g. container ships, tankers).

1.1.8 These Rules include levels of noise and vibration which should be verified by measurements following completion of the ship. It is recommended that the Builders undertake calculations of noise and vibration characteristics so that any potential problem areas can be identified and control measures implemented.

1.1.9 The sound pressure levels for audible alarms and public address systems fitted in accordance with other sections of the Rules are to satisfy IMO Resolution A.1021(26) – *Code on Alerts and Indicators, 2009 – (Adopted on 2 December 2009)*.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 1

1.2 Definitions

1.2.1 **Passenger spaces** are defined as all areas intended for passenger use, and include the following:

- (a) Passenger cabins.
- (b) Public spaces (e.g. restaurants, hospital, lounges, reading and games rooms, gymnasiums, corridors, shops).
- (c) Open deck recreation areas.

1.2.2 **Crew spaces** are defined as all areas intended for crew use only, and include the following:

- (a) Accommodation spaces (e.g. cabins, offices, mess rooms, recreation rooms).
- (b) Work spaces.
- (c) Navigation spaces.

1.2.3 **Noise level** is defined as the A-weighted energy equivalent sound pressure level measured in accordance with ISO 2923.

1.2.4 **Vibration level** is defined by the application of ISO 20283-5.

The vibration level is defined as the overall frequency weighted r.m.s. value of vibration during a period of steady-state operation over the frequency range 1 to 80 Hz.

1.3 Class notations

1.3.1 The class notations described in *Pt 7, Ch 12, 1.3 Class notations 1.3.2 to Pt 7, Ch 12, 1.3 Class notations 1.3.6* provide standards for noise and vibration levels in different spaces at the time of delivery and during the ship's life if substantial changes to the machinery installation or interior arrangements are made.

1.3.2 The **PAC** (Passenger Accommodation Comfort), **CAC** (Crew Accommodation Comfort) and **PCAC** (Passenger and Crew Accommodation Comfort) notations are optional and are primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance, using these requirements as the basis for the assessment and an LR Certificate of Compliance issued (see *Pt 7, Ch 12, 1.1 Scope 1.1.3.(b)* and *Pt 7, Ch 12, 1.4 Certificate of Compliance*).

1.3.3 The **PAC** notation indicates that the passenger accommodation meets the acceptance criteria whilst the **CAC** notation indicates that the crew accommodation and work areas meet the acceptance criteria. The **PCAC** notation indicates that the passenger and crew spaces both meet the acceptance criteria.

1.3.4 For ships which achieve the noise and vibration comfort standards specified in these Rules, the notation **PAC**, **CAC** or **PCAC** will be assigned.

1.3.5 Following the **PAC** or **CAC** notation, numerals **1**, **2** or **3** will indicate the acceptance criteria to which the noise and vibration levels have been assessed. In the case of the **PCAC** notation, two numerals will be assigned. The first will indicate the acceptance criteria for passenger accommodation, whilst the second will indicate the crew comfort criteria.

1.3.6 For particular vessels, impact insulation and transient noise in accordance with *Pt 7, Ch 12, 2.5 Impact insulation* and *Pt 7, Ch 12, 2.6 Transient noise* together with any additional or more stringent noise and vibration criteria may be assessed within the scope of the notations where agreed between the Owner, Builder and LR.

1.4 Certificate of Compliance

1.4.1 A Certificate of Compliance records that a ship has been designed and constructed to satisfy the noise and vibration criteria contained in these Rules. This is to be confirmed by measurements and reporting in accordance with *Sections Pt 7, Ch 12, 4 Testing* and *Pt 7, Ch 12, 5 Noise and vibration survey reporting*.

1.4.2 A Certificate of Compliance is optional and if requested, any ship can be assessed for compliance using the Rule requirements as basis for assessment.

1.4.3 Where noise and vibration levels are at variance with those prescribed by these Rules, these will be added to the certificate for information purposes.

1.4.4 A Certificate of Compliance will be issued after the initial survey required by *Pt 7, Ch 12, 6 Non-periodical survey requirements*.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 2

Section 2 Noise

2.1 Assessment criteria

2.1.1 Where a space is occupied by both passengers and crew, the more stringent of the relevant requirements apply unless agreed between the Builder and Owner and advised to LR.

2.2 Passenger accommodation and public spaces

2.2.1 Under test conditions specified in *Pt 7, Ch 12, 4.2 Test conditions*, the applicable noise levels specified in *Table 12.2.1 Passenger ships - Maximum noise levels in dB(A)* should not generally be exceeded. See *Pt 7, Ch 12, 2.2 Passenger accommodation and public spaces 2.2.3*.

2.2.2 For cabins bordering discotheques and similar entertainment spaces, the deck and bulkhead sound insulation is to be sufficient to ensure that the maximum cabin noise levels are not exceeded even when high external noise levels prevail. Noise from entertainment spaces shall be considered as transient noise and should meet the requirements stated in *Pt 7, Ch 12, 2.6 Transient noise*.

Table 12.2.1 Passenger ships - Maximum noise levels in dB(A)

Location		Acceptance Numeral		
		1	2	3
Passenger cabins:	Standard	49	52	55
	Superior	45	47	50
Public spaces:	Excluding Shops	55	58	62
	shops	60	62	65
Medical centre:		50	55	60
Theatre/auditorium		50	55	60
Open deck recreation areas (excluding swimming pools and similar)		67	72	72
Swimming pools and similar		70	75	75
<p>Note 1. The levels may be exceeded by 5dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks.</p> <p>Note 2. The levels may be exceeded by 3dB(A) in accommodation above the propellers for three decks above the mooring deck.</p> <p>Note 3. The levels for open deck recreation areas refer to ship generated noise only. On open deck spaces the noise generated from the effects of wind and waves can be considered separately to limits agreed between the Builder and Owner and advised to LR for the trial conditions.</p>				

2.2.3 Acceptance of noise levels greater than those specified in *Table 12.2.1 Passenger ships - Maximum noise levels in dB(A)* may be considered where agreed between the Owner and Builder at specification/contract stage. Not more than 20 per cent of the passenger cabins, 30 per cent of the public spaces and 20 per cent of the crew cabins should exceed the relevant noise criteria by more than 3 dB(A).

2.2.4 Acoustic insulation of bulkheads and decks between passenger spaces is to be generally in accordance with the values of the weighted apparent sound reduction index R'_w as given in *Table 12.2.2 Minimum apparent airborne sound insulation indices, R'_w* , calculated using ISO 717/1. See also *Pt 7, Ch 12, 2.2 Passenger accommodation and public spaces 2.2.6*.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 2

Table 12.2.2 Minimum apparent airborne sound insulation indices, R'_w

Location		Acceptance Numeral		
		1	2	3
Passenger cabins:	Standard	41	39	38
	Superior	45	42	40
Cabin to corridor:	Standard	38	36	35
	Superior	42	40	37
Cabin to stairway:	Standard	47	45	43
	Superior	50	47	45
Cabin to public space (excluding corridors/ stairwells and discotheques):	Standard	52	48	48
	Superior	55	50	50
Discotheques to cabins		60	60	60
Discotheques to stairwells and public spaces		52	52	52
Cabin to machinery rooms and engine casing		55	53	50

2.2.5 For the purpose of selecting acoustic sound insulation, the following sound noise levels may be used. The frequency spectrum used should be as defined in ISO 717-1: spectrum No. 2 for discotheques and spectrum No. 1 for others. Evaluation should include the frequency range down to 50 Hz 1/3-octave band:

- (a) Cabins – 80 dB(A).
- (b) Dining Rooms – 85 dB(A).
- (c) Corridors – 90 dB(A).
- (d) Discotheques, Theatres, Entertainment Areas – 105 dB(A).

2.2.6 Acceptance of bulkhead and deck acoustic insulation values less than those specified in Table 12.2.2 Minimum apparent airborne sound insulation indices, R'_w may be considered where agreed between the Owner and Builder. Not more than 20 per cent of the interfaces tested should have airborne sound insulation indices, R'_w , more than 3 dB(A) lower than the minimum specified values.

2.3 Crew accommodation and work areas

2.3.1 Under the applicable test conditions specified in Pt 7, Ch 12, 4.2 Test conditions, the noise levels specified in Table 12.2.3 Crew accommodation - Maximum noise levels in dB(A) and Table 12.2.4 Crew work areas - maximum noise levels in dB(A) are not to be exceeded.

Table 12.2.3 Crew accommodation - Maximum noise levels in dB(A)

Location	Acceptance Numeral			
	1	2	3	
			Ships <10,000 grt	Ships ≥10,000 grt
Sleeping cabins, hospitals	50	53	60	55
Offices, conference rooms and day cabins	55	58	65	60
Mess rooms, lounges, reception areas and recreation rooms within accommodation	55	58	65	60
Recreational areas on open deck	67	72	75	75

Passenger and Crew Accommodation Comfort Part 7, Chapter 12*Section 2*

Alleyways, changing rooms, bathrooms, lockers	70	75	75	75
NOTE The levels may be exceeded by 5 dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks.				

Table 12.2.4 Crew work areas - maximum noise levels in dB(A)

Location	dB(A) level
Machinery space(not continuously manned) e.g. pump, refrigeration, thrusters or fan rooms	110
Workshops and non-specified work spaces	85
Machinery control rooms	75
Wheelhouse, chartrooms, radar rooms	65
Look-out posts e.g. at bridge wing or window	70
Additional limits:	
• 250 Hz band	68
• 500 Hz band	63
(measured according to IMO A.343(IX))	
Radio room	60
Galleys and pantries:	75
• Equipment not working	75
• Individual items at 1 metre	80
Normally unoccupied spaces (e.g. holds, decks)	90
Ship's whistle, on bridge or forecastle	110

2.3.2 Crew space insulation is to comply with the requirements of IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91).

2.4 Maximum noise levels

2.4.1 Where the measured noise level exceeds the specified criterion by 3 dB(A), or contains subjectively annoying low frequency or tonal components, the noise rating (NR) number is to be established in accordance with the graph shown in *Figure 12.2.1 Noise rating curves*. This is achieved by plotting the linear octave band levels on the graph; the NR number is that NR curve to which the highest plotted octave band level is anywhere tangent. The specified criterion may be considered satisfied if the NR number does not exceed the specified A-weighted value minus 5 dB(A).

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 2

Figure 12.2.1 Noise rating curves

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 2

2.4.2 Guidance on maximum acceptable sound pressure levels and noise exposure limits for crew spaces is given in IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91).

2.5 Impact insulation

2.5.1 Where agreed between the Owner, Builder and LR, enhanced criteria for noise levels recognising the effects of impact sound pressures may be applied in accordance with Pt 7, Ch 12, 2.5 Impact insulation 2.5.2 to Pt 7, Ch 12, 2.5 Impact insulation 2.5.5.

2.5.2 For passenger and crew cabins located below or adjacent to dance floors, stages, aerobics and gymnasium areas, jogging tracks or other areas where impact noise is generated, the normalised field measured impact sound pressure level within the cabins is not to exceed 45 dB.

2.5.3 For public rooms under dance floors, stages, aerobics and gymnasium areas, jogging tracks or other areas where impact noise is generated, the normalised field measured impact sound pressure level within the space is not to exceed 55 dB.

2.5.4 For passenger cabins, the normalised field measured impact sound pressure level, $L'_{n,w}$, calculated using ISO 717/2, is to be generally in accordance with the values stated in Table 12.2.5 Passenger cabins normalised field measured impact sound pressure level $L'_{n,w}$. See also Pt 7, Ch 12, 2.5 Impact insulation 2.5.5.

Table 12.2.5 Passenger cabins normalised field measured impact sound pressure level $L'_{n,w}$

Location	dB
Below decks covered with carpet and soft materials	50
Below decks covered in hard materials (such as wood, marble or similar)	60
Below dance floors, theatre or sports rooms	45

2.5.5 Acceptance of normalised impact sound pressure levels greater than those specified in Table 12.2.5 Passenger cabins normalised field measured impact sound pressure level $L'_{n,w}$ may be considered for assignment of the applicable class notation where agreed between the Owner, Builder and LR. No more than 20 per cent of the passenger cabins tested should exceed the levels specified by more than 3 dB.

2.6 Transient noise

2.6.1 Where agreed between the Owner, Builder and LR, enhanced criteria for transient noise levels may be applied in accordance with Pt 7, Ch 12, 2.6 Transient noise 2.6.2.

2.6.2 The maximum sound pressure level ($L_{pAS,max}$) emanating from any machinery or system caused by a single event that produces a noise 'spike' compared to the reference condition sound level (such as vacuum systems or valve operations) is not to cause an increase in noise in comparison with the reference condition (background noise) as below:

- (a) Passenger cabins and public areas: +2 dB(A)
- (b) Officer cabins: +2 dB(A)
- (c) Crew cabins and public areas: +3 dB(A)

A tolerance of +3 dB(A) may be applied to 5 per cent of cabins and public areas in each fire zone on each deck. This criterion is generally applicable to the specified maximum noise levels for the space concerned.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 3

Section 3 Vibration

3.1 Assessment criteria

3.1.1 Where a space is occupied by both passengers and crew, the more stringent of the relevant requirements apply unless agreed between the Builder and Owner and this agreement advised to LR.

3.1.2 The limits apply to vertical, longitudinal and transverse vibrations which are to be assessed separately.

3.1.3 Under test conditions specified in *Pt 7, Ch 12, 4.2 Test conditions*, the applicable vibration levels specified in *Table 12.3.1 Passenger ship - Maximum vibration levels* and *Table 12.3.2 Crew spaces - Maximum vibration levels* should not be exceeded.

3.1.4 Acceptance of vibration levels greater than those specified in *Table 12.3.1 Passenger ship - Maximum vibration levels* and *Table 12.3.2 Crew spaces - Maximum vibration levels* may be considered for assignment of the applicable class notation where agreed between the Owner, Builder and LR.

Table 12.3.1 Passenger ship - Maximum vibration levels

Standard:	ISO 20283-5		
Units:	Frequency weighted velocity level (1–80 Hz), mm/s r.m.s.		
	Acceptance Numeral		
Location	1	2	3
Passenger cabin Luxury	1,5	1,8	2,1
Passenger cabin Standard	1,8	2,1	2,4
Public spaces	2,0	2,5	3,0
Open recreation decks	2,5	3,0	3,5
Note The vibration level may be exceeded by 0,3 mm/s in the ship's aft body directly above the propellers.			

Table 12.3.2 Crew spaces - Maximum vibration levels

Standard:	ISO 20283-5
Units:	Frequency weighted velocity level (1–80 Hz), mm/s r.m.s.
Location	
Accommodation and navigation spaces	3,5
Work spaces	5,0

3.2 Passenger accommodation and public spaces

3.2.1 Passenger spaces are to comply with the overall vibration levels specified in *Table 12.3.1 Passenger ship - Maximum vibration levels* and *Table 12.3.2 Crew spaces - Maximum vibration levels*.

3.2.2 No more than 20 per cent of all passenger spaces/areas and public spaces should exceed the relevant vibration criteria specified in *Table 12.3.1 Passenger ship - Maximum vibration levels* and *Table 12.3.2 Crew spaces - Maximum vibration levels* by more than 0,3 mm/s.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 4

3.3 Crew accommodation and work spaces

3.3.1 Crew spaces are to comply with the overall vibration levels specified in *Table 12.3.2 Crew spaces - Maximum vibration levels*.

■ Section 4 Testing

4.1 Measurement procedures

4.1.1 These requirements take precedence where quoted standards may differ.

4.1.2 The trial measurements may be undertaken by an approved technical organisation as defined in *Pt 7, Ch 12, 4.7 Approved technical organisation* or by LR. In the former case, the measurements are to be witnessed by a LR Surveyor.

4.1.3 Subject to agreement by LR and the Owner/ Operator, the measurements may be undertaken by the Builder. In this case, the measurements are to be witnessed by a LR Surveyor.

4.2 Test conditions

4.2.1 Test conditions for the surveys are to be in accordance with those detailed in ISO 2923 and ISO 20283-5 as applicable.

4.2.2 The intended operating and loading conditions of the ship during assessment surveys are to be submitted to LR for agreement, prior to commencement of surveys.

4.2.3 Surveys are to be conducted when the ship is fully outfitted and all systems contributing to noise and vibration levels are operational.

Note All systems operational are to include those systems that may operate simultaneously with others during normal ship operation.

4.2.4 The test conditions required for the vibration and noise measurements are to be in accordance with the following conditions:

- (a) For passenger ships, prior to measurement surveys being carried out, the ship operating condition where the worst conditions are experienced between 0 and 85 per cent maximum continuous rating of the propulsion machinery is to be determined. To establish this condition, four measurement positions are to be defined with the agreement of LR and measurements taken of the parameters of interest at ship speeds corresponding to percentages of the maximum continuous rating of the propulsion machinery increasing up to 40 per cent MCR in 10 per cent intervals and from 40 per cent in 5 per cent intervals up to the 85 per cent maximum continuous rating of the propulsion machinery. If the 85 per cent maximum continuous rating condition is found to be the worst condition, then this will form the trial operating conditions. However, if a lower speed condition is found to be worse than the 85 per cent maximum continuous rating condition then both that condition and the 85 per cent maximum continuous rating condition will form the trial operating conditions. Where unavoidable any barred range within the values required for the trial operating condition may be excluded on agreement between Owner and Builder subject to approval by LR. Other operating conditions for testing can be agreed between Owner and Builder.
- (b) The power absorbed by the propeller(s) is to be that defined in *Pt 7, Ch 12, 4.2 Test conditions 4.2.4*. Alternatively, by special agreement, some lesser power could be accepted if it can be demonstrated by the Owner that this would correspond to a more representative normal service condition.
- (c) Auxiliary machinery essential for the ship's operating conditions together with HVAC systems are to be running at their normal rated capacity during the noise and vibration trials. Combinations of auxiliary machinery operation may be necessary. In addition, the following equipment is to be running if appropriate: stabilisers, waste treatment equipment, swimming pool and jacuzzi equipment.
- (d) For sea-going ships, measurements are to be taken with the ship proceeding ahead, at a constant speed and course, in a depth of water not less than five times the draught of the ship. For other ships, an appropriate water depth is to be agreed with LR prior to the trials.
- (e) Trials are to be conducted in sea conditions not greater than sea state 3 on the WMO sea state code. In addition, noise measurements should not be taken when the wind force exceeds 4 on the Beaufort scale.
- (f) The ship is to be at a displacement and trim representative of an operating condition.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 4

- (g) Rudder angle variations are to be limited to $\pm 2^\circ$ of the midship position and rudder movements are to be kept to a minimum throughout the measurement periods.
- (h) In addition, for ships which are designed to spend a considerable period of time in harbour, the noise and vibration, are to be measured for this condition, with the auxiliary machinery and HVAC systems running at their normal rated capacity.
- (i) Intermittently run equipment such as transverse propulsion units are to be operated at 40 per cent of their rated power for additional measurements in surrounding ship areas. If such equipment is intended for long-term operation, e.g. stabilisers, or long-term intermittent dynamic positioning (DP) mode, measurements shall be made for ensuring compliance with the general noise and vibration limits. If such systems are intended for short term intermittent operation only, for instance during port manoeuvres, the noise and vibration levels should be measured for information only. Definition of long-term DP mode can be agreed between Owner and Builder.

4.2.5 Prior to survey, a test programme is to be submitted for approval by LR. This programme is to contain details of the following:

- (a) Measurement locations indicated on a general arrangement of the ship.
- (b) The ship's loading condition during survey.
- (c) The machinery operating condition, including HVAC system, during survey.
- (d) Noise and vibration measuring equipment.

4.3 Noise measurements

4.3.1 Noise measurements are to be conducted in accordance with ISO 2923 and IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91). Measurements of noise levels are to be carried out using precision grade sound level meters conforming to IEC 61672-1, Type 1 or 2. Subject to demonstration, equivalent standards are acceptable.

4.3.2 Where the measured noise level exceeds the relevant criterion by 3 dB(A), or contains subjectively annoying low frequency noise or obvious tonal components, octave band readings are to be taken, with centre frequencies from 31,5 Hz to 8 kHz.

4.3.3 When outfitting is complete, and all soft furnishings are in place, sound insulation indices for passenger spaces are to be determined in accordance with ISO 16283-1. Cabin to cabin indices are to be determined from a minimum of three locations for each cabin type within the passenger accommodation, the number of test locations being agreed with LR. If the partition surface area is less than 10 m², an area of 10 m² shall be used for the calculation of the R'_w index, unless otherwise agreed.

4.3.4 If required, impact sound measurements are to be carried out in accordance with ISO 16283-2 and presented in accordance with ISO 717/2. See Pt 7, Ch 12, 4.4 Noise measurement locations 4.4.4.

4.4 Noise measurement locations

4.4.1 Measurement locations are to be chosen so that the assessment represents the overall noise environment on board the ship. In addition to the requirements of IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91) for crew spaces, all public spaces shall be surveyed. For passenger cabins the following minimum number of cabins shall be measured:

- $n < 10$: all cabins,
- $n < 50$: 50 per cent of cabins,
- $n < 500$: 25 per cent of cabins,
- $n > 500$: 15 per cent of cabins

where n is the total number of passenger cabins.

At least 40 per cent of the crew cabins shall be measured. For ships with a large number of crew cabins, e.g. cruise ships, a minimum of 15 per cent of the crew cabins should be measured. 50 per cent of the measurements in crew and passenger areas shall be located in the after third of the ship. Distribution of the measurement locations is to be agreed by LR.

4.4.2 During measurement trials, recognised noise sources are to be operated at their normal level of noise output (e.g. machinery at design rating).

4.4.3 In larger sized spaces, where noise levels may vary considerably, such as restaurants, lounges, atria and open deck recreation areas, measurements are to be taken at locations not greater than 7 m apart.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 5

4.4.4 The number of and locations for impact noise measurements are to be agreed between the Builder, Owner and LR. The measurements are to be carried out when the ship is in a condition with steady and low background noise. The number and location of measurements are to take account of all different combinations of construction, areas of application, types of cabin and spaces below.

4.5 Vibration measurements

4.5.1 Vibration measurements are to be conducted in accordance with ISO 20283-5.

4.5.2 Measurements are to be made with instrumentation meeting the requirements of ISO 8041.

4.5.3 Vibration levels are to be given in terms of the velocity measurement appropriate to the version of the standard being used and should be measured over a period of not less than one minute.

4.6 Vibration measurement locations

4.6.1 Measurement locations are to be chosen so that the assessment represents the overall vibration environment onboard the ship. To minimise survey times, readings may be taken at the locations previously defined for the noise assessment part of the survey.

4.6.2 In cabins, vibration readings are to be taken in the centre of the floor area. The measurements are to indicate the vibration of the deck structure. In large spaces, such as restaurants, sufficient measurements are required to define the vibration profile.

4.6.3 Where deck coverings make transducer attachment impracticable, use of a small steel plate having a mass of at least 1 kg, with spikes as appropriate, is permissible.

4.6.4 At all locations, vibrations in the vertical direction are to be assessed. Sufficient measurements in the longitudinal and transverse directions are to be taken to define global deck vibrations in at least two locations on each deck.

4.7 Approved technical organisation

4.7.1 An approved technical organisation for the purposes of these Rules is one that is acceptable to the Owner and LR with proven capability in noise and vibration measurement and satisfies all the criteria set out below:

- (a) Have instrumentation whose calibration, both before and after the measurements, can be traced back to National Standards and, hence, back to International Standards.
- (b) Have analysis procedures capable of data reduction to the requirements and standards set out in these Rules.
- (c) Be able to provide a written report in English with contents as defined by *Pt 7, Ch 12, 5 Noise and vibration survey reporting*.

■ Section 5

Noise and vibration survey reporting

5.1 General

5.1.1 Prior to survey, a noise and vibration measurement plan is to be agreed by the Owner, Builder and LR.

5.1.2 The survey report is to comprise the data and analysis for both noise and vibration and is to be submitted to LR for consideration.

5.1.3 The survey report is to be prepared by the organisation undertaking the trial measurements, which may be an approved technical organisation or LR.

5.1.4 The survey report is to be submitted to LR for evaluation and confirmation that the results are in accordance with the noise and vibration levels specified in these Rules and/or agreed between the Owner and Builder. The assignment of a Class Notation or the issue of a Statement of Compliance will be subject to confirmation by LR.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 6

5.2 Noise

5.2.1 The reporting of results is to comply with ISO 2923 and IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012)* The Annex below is consolidated into Resolution MSC.337(91), and is to include:

- (a) Measurement locations indicated on a general arrangement plan including, where possible, the measured dB(A) level.
- (b) Tabulated dB(A) noise levels, together with octave band analysis for positions where the level exceeds the specified criterion by 3 dB(A), or where subjectively annoying low frequency or tonal components were present. The Noise Rating number is also to be given where octave band analyses have been conducted.
- (c) Ship and machinery details.
- (d) Trial details:
 - Loading condition.
 - Machinery operating condition.
 - Speed.
 - Average water depth under keel.
 - Weather conditions.
 - Sea state.
 - Draught.
- (e) Details of measuring and analysis equipment (e.g. manufacturer, type and serial numbers), including frequency analysis parameters (e.g. resolution, averaging time, window function).
- (f) Copies of the relevant instrument calibration certificates, together with the results of field calibration checks.

5.3 Vibration

5.3.1 The report is to contain the following information:

- (a) Measurement positions indicated on a general arrangement plan.
- (b) Where ISO 20283-5 is used, the frequency-weighted overall r.m.s. vibration levels tabulated for all measurement locations calculated using the weighting functions and methodology stated in the standard.
- (c) Ship and machinery details.
- (d) Trial details:
 - Loading condition.
 - Machinery operating condition.
 - Speed.
 - Average water depth under keel.
 - Weather conditions.
 - Sea state.
 - Draught.
- (e) Frequency analysis parameters (e.g. resolution, averaging time and window function), if the analysis is done in the frequency domain.
- (f) Copies of the relevant instrument calibration certificates, together with the results of field calibration.

■ Section 6

Non-periodical survey requirements

6.1 Class notation assignment

6.1.1 Where the assignment of a Class Notation or a Statement of Compliance is requested, an Initial Survey is to comprise sea trial or initial in-service testing, reporting and assessment against the criteria set out in these Rules.

6.1.2 The sea trial or initial in-service testing requirements are set out in *Pt 7, Ch 12, 4 Testing*, and are to be reported in accordance with *Pt 7, Ch 12, 5 Noise and vibration survey reporting* and evaluated against the requirements of Sections *Pt 7, Ch 12, 2 Noise* and *Pt 7, Ch 12, 3 Vibration*.

Passenger and Crew Accommodation Comfort Part 7, Chapter 12

Section 7

6.2 Maintenance of class notation through-life and following modifications

6.2.1 Where an Owner has requested assignment of a Class Notation, arrangements are to be agreed between LR and the Owner to record observations/complaints of excessive noise and vibration that have been such as to disturb the comfort of passengers and crew. The records of the observations are to be made available to the attending LR Surveyor at each Annual Survey.

6.2.2 Where the observations indicate that the noise and/or vibration levels may exceed the criteria relating to the Class Notation requirements and those measured at the Initial Survey, a measurement programme is to be agreed between the Owner and LR and measurements taken in accordance with these Rules.

6.2.3 A Renewal Survey may be required following modifications, alterations or repairs including replacement of major machinery items. It is the responsibility of the Owner to advise LR of such modifications.

■ Section 7

Referenced Standards

7.1 Noise

7.1.1 The following National and International Standards for noise are referred to in these Rules:

- ISO 2923:1996/Cor 1:1997, *Acoustics – Measurement of noise on board vessels*.
- ISO 717-1:2013, *Acoustics – Rating of sound insulation in buildings and of building elements; Part 1: Airborne sound insulation*.
- ISO 717-2:2013, *Acoustics – Rating of sound insulation in buildings and of building elements; Part 2: Impact sound insulation*.
- IMO Resolution MSC.337(91) – *Adoption of the Code on Noise Levels on Board Ships – (Adopted on 30 November 2012) The Annex below is consolidated into Resolution MSC.337(91)*.
- IEC 61672, *Sound level meters* (all parts), or earlier versions, .
- ISO 16283-1:2014/Amd 1:2017, *Acoustics – Field measurement of sound insulation in buildings and of building elements – Part 1: Airborne sound insulation*
- ISO 16283-2:2018, *Acoustics – Field measurement of sound insulation in buildings and of building elements – Part 2: Impact sound insulation*.

7.2 Vibration

7.2.1 The following National and International Standards for vibration are referred to in these Rules:

- ISO 20283-5:2016, *Mechanical vibration – Measurement of vibration on ships – Part 5: Guidelines for measurement, evaluation and reporting of vibration with regard to habitability on passenger and merchant ships*.
- ISO 8041-1:2017, *Human response to vibration – Measuring instrumentation – Part 1: General purpose vibration meters* (or earlier versions).

Section

- 1 **General**
- 2 **Essential features**
- 3 **Electrical Connection**
- 4 **Electrical System**
- 5 **Control and monitoring**
- 6 **Testing, trials and surveys**

■ *Section 1* **General**

1.1 General

1.1.1 These optional requirements apply to the safety, reliability and availability of shipboard machinery, electrical and control engineering arrangements installed to permit continued operation of services by connection to an external electrical power supply in port. These requirements are additional to those applicable in other Parts of the Rules. Regular operation of ship's services from an external electrical power supply is often referred to as On-shore Power Supply, Cold Ironing, High Voltage Shore Connection or Alternative Marine Power.

1.1.2 These requirements are intended for application to the shipboard elements of designs where the connection(s) with external power supply arrangements are achieved by either extending ship cables from the ship to the external power supply connection points or by bringing external cables on board to connect to shipboard connection points. However, external equipment and machinery (including shore based transformers, circuit breakers, gantries, cables, connectors and control engineering arrangements) are not covered by classification or these requirements.

1.1.3 Compliance with these requirements is intended to assess the suitability of shipboard arrangements for the documented intended application and only addresses compatibility with external power supply arrangements that are suitable for connection to the installed ship arrangements.

1.1.4 Assessment of the overall compatibility and suitability of an external electrical power supply (including combined electrical and control engineering assessments, compliance with applicable regulations, operating practices and risk assessment, etc. as applicable) is necessary before connection and is the responsibility of the Owner. Elements of the overall assessment of compatibility will be required to be completed in advance to prepare for a ship visit to a port where it is intended to connect to an external power supply due to the need to involve competent and responsible parties.

1.2 Authorities and administrations

1.2.1 Additional requirements and/or restrictions may be imposed by the National Authority with which the ship is registered and/or by the appropriate Administration or Authorities within whose jurisdiction the ship is intended to operate and/or by the Owners or Authorities responsible for an external electrical power supply. Where such additional requirements are relevant, compliance is the responsibility of the Owner. If specifically requested, Lloyd's Register (hereinafter referred to as 'LR') may be able to provide a suitable statement of compliance.

1.2.2 Where additional requirements imposed by an Authority or Administration would result in a departure from the requirements of this Chapter, details demonstrating that safety, availability and reliability will not be adversely affected are to be submitted to LR for consideration.

1.3 Class notations

1.3.1 **OPS** machinery class notation may be assigned where machinery, electrical and control engineering arrangements installed onboard to permit continued operation of services by connection to an external electrical power supply are assessed and found to comply with the requirements of this Chapter.

1.4 Plans and information

1.4.1 Three copies of the plans and particulars in *Pt 7, Ch 13, 1.4 Plans and information 1.4.2 to Pt 7, Ch 13, 1.4 Plans and information 1.4.9* are to be submitted for consideration.

1.4.2 Operating Manuals that describe the intended methods of connection together with operating and monitoring instructions. Assessments of the external supplies that are to be connected to the ship together with the mooring and environmental conditions are to be included. Details of equipment and arrangements necessary to ensure safety when connecting, disconnecting, transferring electrical load, testing and operating are to be incorporated.

1.4.3 A Design Statement which details the Defined Operations. This statement is to include a description of the operating capability, functionality, limits and restrictions; in terms of:

- Connection Equipment, see *Pt 7, Ch 13, 1.6 Definitions 1.6.2*;
- Connection Equipment routes;
- mooring arrangements;
- environmental conditions including tidal and weather and, where applicable, electromagnetic conditions required to ensure compatibility or prevent damage caused by heating or sparking;
- Connection Equipment suitability for hazardous areas, see *Pt 7, Ch 13, 2.1 General requirements 2.1.4* and *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.6*
- arrangements for an external connection cable to be brought on board, where provided;
- Separation details, see *Pt 7, Ch 13, 3.2 Connection Equipment 3.2.7*;
- the rating of the arrangements;
- ratings and requirements for external power supplies, see *Pt 7, Ch 13, 3.1 General 3.1.10*; and
- the services to be supplied.

1.4.4 Arrangement plans of equipment, control stations, locations, routes to and from connections, openings and accesses and flexible or movable arrangements.

1.4.5 Operational and construction details of Connection Equipment, including any flexible or adjusting arrangements, including plugs and socket-outlets, see *Pt 7, Ch 13, 3.3 Connection cables, plugs and socket-outlets 3.3.4*.

1.4.6 Plans for control and electrical engineering arrangements required by *Pt 6, Ch 1 Control Engineering Systems* and *Pt 6, Ch 2 Electrical Engineering*, as applicable.

1.4.7 Details of type tests for Connection cables, plugs and socket-outlets required by *Pt 7, Ch 13, 3.3 Connection cables, plugs and socket-outlets 3.3.6*.

1.4.8 Details of supplementary arrangements required to protect equipment from exposure to moisture, condensation or temperatures outside their rating.

1.4.9 Schedule of testing at manufacturers' works, initial surveys and trials. The test schedules are to address the defined operations and are to include normal operations and failure conditions.

1.5 Additions and alterations

1.5.1 When an alteration or addition to the approved arrangements is proposed, including changes to the defined service profile, details are to be submitted for consideration.

1.6 Definitions

1.6.1 'Defined Operations' include the application, connection, electrical load transfer, in-service operation, failure response, disconnection and stowage of the connection to an external power supply.

1.6.2 'Connection Equipment' is the ship equipment used to connect permanently installed ship equipment with external electrical power supply connection points in accordance with the Design Statement. This includes, as applicable, flexible cables, plugs and socket-outlets, slip rings or other power conductors or control connections, and support and management measures for these connections. For the purposes of this Chapter, 'Connection Equipment' does not include external equipment, see *Pt 7, Ch 13, 1.1 General*.

■ Section 2 Essential features

2.1 General requirements

2.1.1 Connection equipment is to be designed to be compatible with ship mooring arrangements and the limits of acceptable forces, moments and deflections on correctly applied Connection Equipment resulting from the movement of the moored ship under normal operational circumstances is to be defined in the Design Statement.

2.1.2 Electrical and control engineering arrangements for operation with external electrical power supplies are to be in accordance with the requirements of *Pt 6, Ch 1 Control Engineering Systems* and *Pt 6, Ch 2 Electrical Engineering*, as applicable.

2.1.3 Connection to an external electrical power supply is not to adversely affect the availability of main, auxiliary or emergency machinery, including ship sources of electrical power to allow ship power to be restored. Details of arrangements provided to maintain availability (for example, pre-heating and lubrication and availability of starting, fuel, lubrication, air and auxiliary systems) are to be included in the Design Statement, *see also Pt 7, Ch 13, 4.5 Ship power restoration* and *Pt 7, Ch 13, 5.1 General 5.1.9*.

2.1.4 The permanent or temporary installation of electrical equipment in areas containing flammable gas or vapour and/or combustible dust, is to be minimised as far as is consistent with operational necessity and the provision of facilities enhancing the overall safety of the ship and connection to an external power supply. Where it is necessary to install electrical equipment in these areas, the arrangements are to be in accordance with the requirements of *Pt 6, Ch 2, 14 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts*. The suitability of electrical Connection Equipment for operation in areas containing flammable gas and/or vapour and/or combustible dust while in port is to be defined in the Design Statement and should, additionally, address the implications for Connection Equipment extended ashore, where applicable, and the suitability for operation in berths requiring extended, hazardous areas.

2.1.5 As far as practicable, Connection Equipment is to be located outside of areas where it could be damaged by inport activities under normal operational circumstances.

2.1.6 Consideration may be given to arrangements that are considered by LR to provide an equivalent level of safety. Evidence demonstrating compliance with IEC/ISO/IEEE 80005-1: *Electrical installations in ships – Special features: High-voltage shore connection systems*, or a relevant National Standard may be submitted for consideration of acceptability by LR.

■ Section 3 Electrical Connection

3.1 General

3.1.1 A connection cubicle is to be provided at a convenient location for the reception or extension of connection cable(s) for connection to the external electrical power supply connection points. The connection cubicle is to contain terminals for the connection cable(s) that can be isolated.

3.1.2 Power connections with external electrical power supply arrangements may be made with either suitable connections or by using socket-outlets and plugs in accordance with *Pt 7, Ch 13, 3.3 Connection cables, plugs and socket-outlets*.

3.1.3 Suitable cables, permanently fixed, are to be provided from the connection cubicle to the Connection Circuit-Breaker switchboard, with on-board overcurrent protection situated at or as close as is practicable to the connection cubicle. Connection Equipment to this overcurrent protection is to be installed in a manner such as to minimise the risk of short-circuit.

3.1.4 Where shipboard connection cables are extended to the external electrical power supply connection points, the connection cubicle is to be situated as close as practicable on board to the point where they are extended from the ship.

3.1.5 Means are to be provided to permit the quality of insulation between Connection Equipment conductors, and between the conductors and earth to be measured to verify suitability prior to the connection of an external power supply. The means of verifying satisfactory insulation quality of Connection Equipment in hazardous areas is to be addressed in the Operating Manuals, *see Pt 7, Ch 13, 1.4 Plans and information 1.4.2*.

3.1.6 An earth connection is to be provided for connecting the hull to an earth appropriate for the external electrical power supply which is being connected.

3.1.7 For high voltage connections, means are to be provided, as applicable to the design, to either:

- (a) permit termination of circuits used by external power supply equipment to monitor the continuity of the earth connection referred to in *Pt 7, Ch 13, 3.1 General 3.1.6*; or
- (b) monitor the continuity of the earth connection referred to in *Pt 7, Ch 13, 3.1 General 3.1.6*, see *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.8*.

3.1.8 Means are to be provided for checking the phase sequence of the incoming supply.

3.1.9 An indicator is to be provided at the Connection Circuit-Breaker switchboard, and at the connection cubicle if in a different location, in order to show when connections are energised.

3.1.10 Requirements for an external electrical power supply to be connected are to be defined in the Design Statement and this is to detail the following:

- connections, including control, alarm and safety systems and data communication links;
- Emergency Shutdown requirements, see *Pt 7, Ch 13, 5.3 Emergency Shutdown*;
- nominal voltage(s) or voltage range;
- nominal frequency or frequency range;
- number of phases and system of supply;
- rated current or apparent power;
- quality of power supply;
- reference to protection system design, including protection characteristics for the Connection Circuit-Breaker;
- maximum permitted prospective fault level;
- minimum supply apparent power or current capacity;
- earth fault limiting requirements for earthed high voltage connections;
- isolation and earthing; and
- supply requirements for lightning and surge protection, galvanic isolation of supply circuit from other ships, etc.

Required electrical characteristics are to address steady state, transient and fault conditions, as necessary.

3.1.11 A notice is to be provided at the connection cubicle referencing the Operating Manuals and Design Statement and advising of the requirement to ensure that external electrical power supplies satisfy the requirements of *Pt 7, Ch 13, 3.1 General 3.1.10* prior to connection. See *Pt 7, Ch 13, 1.1 General 1.1.4* for the conducting of the assessment of overall compatibility.

3.2 Connection Equipment

3.2.1 Connection Equipment support and management arrangements, including those for control engineering arrangements, are to be arranged not to apply damaging forces or tension to correctly applied equipment. Support arrangements are to ensure that the weight of connected cable is not borne by cable end terminations or connections, including those in plugs or socket-outlets.

3.2.2 Connection Equipment arrangements are to be such as not to coil or twist correctly applied equipment in a manner that would result in heating or physical tension beyond its rating during Defined Operations.

3.2.3 Where Connection Equipment passes through support or management arrangements or structural openings or is placed against structures, it is to be suitably protected against damage having regard to the Defined Operations.

3.2.4 Connection Equipment routes are not to reduce the effectiveness of openings required for the safety of the ship, for instance bulkhead or deck penetrations, watertight or fire doors.

3.2.5 Connection Equipment support and management arrangements are to be able to operate satisfactorily without damage during the Defined Operations.

3.2.6 Means are to be provided for Connection Equipment to be readily and safely adjusted in response to tidal changes, and other movements that could lead to damage or failure of connections, during the Defined Operations.

3.2.7 Connections with external electrical power supply arrangements are to be designed to prevent damage to the ship structure or Connection Equipment cable reels, cranes and/or gantries as a result of the connections separating in the event of the ship leaving a berth inadvertently or as a result of high cable tension for other reasons. Evidence of compliance with this requirement is to be included in the submission required by *Pt 7, Ch 13, 1.4 Plans and information 1.4.3* and is to identify

Connection Equipment (weak points) that will be damaged, if any, in the event of separation. Damage to connection cables, plugs and socket outlets or other identified equipment may be considered.

3.2.8 Connection Equipment cable reels, cranes and/or gantries used to manage, handle or adjust connection cables, plugs and/or socket-outlets, are to be designed and manufactured in accordance with applicable LR Rules or a marine standard acceptable to LR. A manufacturer's certificate verifying suitability for safe and effective operation for the Defined Operations and service profile is to be submitted.

3.2.9 The manufacturer's certificate referred to in *Pt 7, Ch 13, 3.2 Connection Equipment 3.2.8* is to be in the English language and include the following information:

- (a) Design and manufacturing standard(s) used.
- (b) Materials used for construction of key components and their sources.
- (c) Details of the quality control system applied during design, manufacture and testing.
- (d) Details of any existing type approval or type testing.
- (e) Details of installation and testing recommendations.

The manufacturer is to have a recognised quality management system certified by an IACS member or a Notified Body.

3.2.10 Connection cubicle and connection equipment locations are to have warning notices placed in prominent positions to indicate the presence of moving equipment, electricity and high voltage as applicable.

3.2.11 Effective means are to be provided to prevent the accumulation of moisture and condensation within equipment enclosures. Failure of heaters and/or ventilation fans provided to satisfy this requirement is to activate an alarm at a machinery control station that is attended while connected to an external power supply. The installation of open deck enclosures for high voltage connections is to be minimised to that required for the Defined Operations; a technical justification, including proposed degree of protection ratings, is to be included in the submission required by *Pt 7, Ch 13, 1.4 Plans and information 1.4.8*.

3.2.12 Connection Equipment support and management arrangements are to ensure that the correctly applied equipment is kept clear of areas where they may be exposed to moisture or temperatures outside their rating.

3.2.13 Arrangements are to be provided for stowage of on-board equipment when not in use such that equipment:

- will not be exposed to environmental conditions outside its rating;
- can be stowed, stored and removed without damage; and
- does not present a hazard during normal ship operation.

Adapters, extensions and parts dismantled after use are also to be provided with stowage arrangements.

3.3 Connection cables, plugs and socket-outlets

3.3.1 Plugs and socket-outlets for external electrical power supply connection points, including those for external control engineering arrangements, are to be designed constructed and tested in accordance with IEC 62613-1: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC Systems) – Part 1: General requirements* or a relevant National Standard.

3.3.2 Plugs are to conform to applicable requirements that ensure compatibility with the intended socket-outlet type. Compatible plugs and socket-outlets are to be in accordance with IEC 62613-2: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC-Systems) – Part 2: Dimensional compatibility and interchangeability requirements for accessories to be used by various types of ships* or a relevant National Standard.

3.3.3 Type tests are to be carried out on power connection plug and socket-outlets and cables, in accordance with IEC 62613-1: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC Systems) – Part 1: General requirements* and Annex A.3 of the IEC/ISO/IEEE 80005-1:2012: *Electrical installations in ships – Special features: High-voltage shore connection systems respectively* or a relevant National Standard, to verify design suitability for the intended application described in the Design Statement. Type test reports are to be submitted that include details of the standards, the tests conducted and their order and the acceptance criteria. Alternative proposals may be submitted for consideration.

3.3.4 Power connection plugs and socket-outlets are to be assigned with ratings based on testing in accordance with IEC 62613-1: *Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC Systems) – Part 1: General requirements* or a relevant National Standard. Details are to be provided in the submission required by *Pt 7, Ch 13, 1.4 Plans and information 1.4.5*.

3.3.5 Power connection plugs and socket-outlets are to be located to minimise the potential of arc flash hazards and suitable warning notices are to be provided at locations along Connection Equipment routes, including power connection plugs and socket-outlets operational locations.

3.3.6 Connection Equipment power cables are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 3* or, alternatively, surveyed by the Surveyors during manufacture and testing to assess compliance with *Pt 7, Ch 13, 3.3 Connection cables, plugs and socket-outlets 3.3.3* and application of an acceptable quality management system, see also *Pt 6, Ch 2, 1.4 Surveys 1.4.6*. Connection equipment cables are to be installed so as to minimise the risk of short-circuit when correctly applied.

3.4 Containers

3.4.1 Connection Equipment installed in removable containers is to satisfy the additional requirements of this sub- Section.

3.4.2 Containers are to be for the ship's exclusive use and are to be provided with a permanent notice indicating the ship name and IMO Ship Number.

3.4.3 Container locations are to be designated and identified in the plans required by *Pt 7, Ch 13, 1.4 Plans and information 1.4.4* and provided with fixings that are suitable for the Defined Operations. Procedures for container fixing, use and movement are to be included in the Operating Manuals.

3.4.4 The container type is to be a steel, closed type, weatherproof construction sufficient to prevent damage during expected use, for example during loading and unloading.

3.4.5 Measures necessary to prevent movement of the container when the container has electrical cables connected are to be provided.

3.4.6 Suitable protection is to be provided to prevent damage to Connection Equipment at the container entry points.

3.4.7 Suitable safe access is to be provided to the container for the Defined Operations, inspection and maintenance.

3.4.8 Container entry points are to be provided with suitable sealing arrangements to prevent the ingress of water into the container.

3.4.9 Containers are to be provided with effective means of ventilation. Where a container ventilation fan is provided, alarms are to be provided in accordance with *Pt 7, Ch 13, 3.2 Connection Equipment 3.2.11*.

3.5 High voltage in the presence of personnel

3.5.1 The Defined Operations are, as far as is practical, not to require personnel to be in the vicinity of high voltage equipment when it is energised.

3.5.2 For high voltage:

- (a) switchgear and controlgear assemblies;
- (b) cable reels, cranes and gantries; and
- (c) mounting enclosures for socket-outlets used to connect flexible cables to fixed connections;

arrangements are to be made to protect personnel in the event of gases, arc flash or vapours escaping under pressure as the result of arcing due to an internal fault. Where the Defined Operations require personnel to be in the vicinity of such equipment when it is energised, this may be achieved by an assembly that has been tested in accordance with Annex A of IEC 62271-200 and qualified for classification IAC (internal arc classification), or equivalent.

■ Section 4 Electrical System

4.1 Electrical Load Transfer

4.1.1 'Dead transfer' arrangements are to be provided that permit transfer between operation using ship sources of electrical power and an external electrical power supply by disconnecting one from the ship distribution system and then connecting the other to the dead system.

4.1.2 Additional arrangements for connecting ship sources of electrical power and an external electrical power supply in parallel temporarily to transfer load from one to the other only are permitted, provided these are in accordance with *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.3 to Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.9*.

4.1.3 Means to automatically synchronise a ship source of electrical power with an external electrical power supply and connect them in parallel for load transfer when requested by operating staff are to be provided.

4.1.4 Means to automatically transfer load between a ship source of electrical power and an external electrical power supply following their connection in parallel, are to be provided. The load transfer is to be completed in as short a time as practicable without causing machinery or equipment failure or operation of protective devices and this time is to be used as the basis for defining the Transfer Time Limit required by *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.5*.

4.1.5 When transferring of load between ship sources of electrical power and an external electrical power supply exceeds a defined Transfer Time Limit then, arrangements are to be such that:

- the transfer is aborted;
- load is removed from the ship sources of electrical power or external electrical power supply that was intended to take the load; and then
- the Connection Circuit-Breaker is opened.

An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply when the Transfer Time Limit is exceeded and is to indicate the return to previous operating conditions.

4.1.6 The Transfer Time Limit referred to in *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.5* may be adjustable to match the ability of an external electrical power supply to accept and shed load. Setting of the Transfer Time Limit is to be demonstrated to the attending Surveyor at Surveys and Trials, see *Pt 7, Ch 13, 6.1 General*.

4.1.7 An external power supply may only be connected in parallel with a single ship source of electrical power. Arrangements are to be provided to ensure that this requirement is satisfied before and during parallel connection. Details of alternative proposals may be submitted for consideration.

4.1.8 Arrangements provided to adjust ship sources of electrical power to allow connection in parallel and transfer of load are not to cause machinery or equipment failure, operation of protective devices or damage under normal conditions or in the event of a failure.

4.1.9 Where load reductions are required to transfer load they are not to result in loss of essential services or the loss of availability of emergency services. Means are to be provided to readily make necessary load reductions and re-instate supplies following transfer.

4.2 Capacity

4.2.1 Arrangements for operating from external supplies are to be sufficiently rated to supply the following:

- essential services normally required in port;
- emergency services;
- services required to ensure ready availability of non-operating main and auxiliary machinery;
- services required to prevent damage to cargo or stores; and
- the services required for the Defined Operations.

The schedule of loads required by *Pt 6, Ch 2, 1.3 Documentation required for supporting evidence 1.3.3* is to incorporate operation when connected to an external electrical power supply.

4.2.2 The maximum electrical step load switched on or off is not to cause the power supply quality to exceed the parameters given in *Pt 6, Ch 2, 1.8 Quality of power supplies* or failure when connected to an external electrical power supply in accordance with the defined requirements, see *Pt 7, Ch 13, 3.1 General 3.1.10*.

4.2.3 Consideration is to be given to providing means to inhibit automatically the connection of large motors, or the connection of other large loads, that the arrangements are not rated to supply when connected to an external electrical power supply having the defined minimum apparent power or current capacity, see *Pt 7, Ch 13, 3.1 General 3.1.10* and *Pt 6, Ch 2, 6.9 Load management 6.9.4*.

4.3 Protection

4.3.1 Where an external electrical power supply is not arranged to operate in parallel with ship sources of electrical power, the connection to the external electrical power supply is to be provided with a Connection Circuit-Breaker arranged to open simultaneously, in the event of short-circuit, overload or undervoltage, all insulated poles.

4.3.2 Where an external electrical power supply is arranged to operate in parallel with ship sources of electrical power during load transfer, the connection to the external electrical power supply is to be provided with a Connection Circuit-Breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an undervoltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in accordance with the rating defined in the Design Statement; a fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the circuit breaker.

4.3.3 The electrical system, including short-circuit protective device rating, is to be suitable for the highest prospective fault level at the point of installation. The short-circuit current calculations required by *Pt 6, Ch 2, 1.2 Documentation required for design review 1.2.6* are to identify the system state that would result in the highest prospective fault level. The highest prospective fault level may occur during parallel connection with an external power supply and the resulting combination of:

- (a) ship sources of electrical power, taking into account *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.7*; and
- (b) an external electrical power supply having the defined maximum permitted prospective fault level, see *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.7*.

Details of alternative proposals may be submitted for consideration.

4.3.4 The connection circuit is to be arranged such that contamination due to the products of arcing as a result of a fault in the Connection Circuit-Breaker enclosure on the external power supply side will not result in essential or emergency services not being available when supplied by ship sources of electrical power.

4.3.5 Initial connection of an external electrical power supply to the ship switchboards or converter equipment to connect to ship loads is to be arranged to be made by closing of the Connection Circuit-Breaker only.

4.3.6 Converter equipment used to connect an external electrical power supply to the ship electrical system is to ensure that a supply that would result in damage is not applied to the connected ship electrical systems in the event of a failure.

4.3.7 The voltage and time delay settings of the Connection Circuit-Breaker undervoltage release mechanism(s) are to be selected to ensure that the discriminative action required by *Pt 6, Ch 2, 6.1 General 6.1.1* is maintained.

4.3.8 Means are to be provided to prevent closure of the Connection Circuit-Breaker when a connected external electrical power supply has a different phase rotation or has a voltage or frequency that does not match the ship electrical system rating within the tolerances defined by *Pt 6, Ch 2, 1.8 Quality of power supplies 1.8.2* or *Pt 6, Ch 2, 1.8 Quality of power supplies 1.8.5*. Signals are to be provided, where necessary, to allow comparison with ship electrical system characteristics.

4.3.9 Connection power circuits are to be provided with protection against earth faults in accordance with *Pt 6, Ch 2, 6.4 Protection against earth faults*.

4.4 Interlocking and synchronising arrangements

4.4.1 External electrical power supply connections are to be provided with instruments and devices on board equivalent to those required for alternating current generators by *Pt 6, Ch 2, 7.11 Instruments for alternating current generators 7.11.1* where synchronising is not provided, or by *Pt 6, Ch 2, 7.11 Instruments for alternating current generators 7.11.2* to *Pt 6, Ch 2, 7.11 Instruments for alternating current generators 7.11.3* where synchronising for load transfer is provided. See also *Pt 6, Ch 2, 7.11 Instruments for alternating current generators* and *Pt 6, Ch 2, 7.12 Instrument scales*.

4.4.2 Means are to be provided to ensure that a source of electrical power or electrical power supply can only be connected to other live parts when synchronised. See also *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.2* for temporary parallel connection for load transfer.

4.4.3 The arrangements are to prevent Connection Equipment power conductors being made live by connecting to the ship electrical system.

4.4.4 The simultaneous connection of a ship source of electrical power and external electrical power supply to the same dead part of the electrical system is to be prevented.

4.4.5 For high-voltage connections, suitable means are to be provided to earth the connection power circuit so that it is discharged and so maintained that it is safe to touch.

4.4.6 Means provided to connect a connection power circuit to earth are to be arranged such that the circuit may only be earthed when it is isolated.

4.4.7 Interlocking arrangements are to be provided to prevent the connection of a high-voltage external power supply to a switchboard connected to earth using the means required by *Pt 6, Ch 2, 7.8 Earthing of high-voltage switchboards*.

4.5 Ship power restoration

4.5.1 When the ship main source of electrical power is shutdown and failure of the connected external electrical power supply occurs, the Connection Circuit-Breaker is to be arranged to automatically open followed by:

- (a) connection of the emergency source of electrical power to emergency services in accordance with *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1* or *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1* as applicable; and
- (b) automatic connection of the transitional source of electrical power to emergency services in accordance with *Pt 6, Ch 2, 3.3 Emergency source of electrical power in passenger ships 3.3.1* or *Pt 6, Ch 2, 3.4 Emergency source of electrical power in cargo ships 3.4.1* as applicable; and
- (c) automatic starting and connecting to the main switchboard of the main source of electrical power and automatic sequential restarting of essential services, in as short a time as is practicable. *See also Pt 7, Ch 13, 2.1 General requirements 2.1.3 and Pt 6, Ch 2, 2.2 Number and rating of generators and converting equipment 2.2.3.*

Failures include loss of power, disconnection, phase failure and quality of supply outside the tolerances given in *Pt 6, Ch 2, 1.8 Quality of power supplies 1.8.2* or *Pt 6, Ch 2, 1.8 Quality of power supplies 1.8.5*.

4.5.2 An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply to indicate activation of the automatic power supply failure response required by *Pt 7, Ch 13, 4.5 Ship power restoration 4.5.1*. The alarm is to indicate the failure that caused the activation.

4.5.3 The automatic power supply failure response required by *Pt 7, Ch 13, 4.5 Ship power restoration 4.5.1* is to be inhibited during the 'dead transfer' required by *Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.1* but arrangements are to permit personnel to readily revert to operation from ship sources of electrical power if the 'dead transfer' to the external electrical power supply is not completed.

Section 5 Control and monitoring

5.1 General

5.1.1 Control engineering arrangements are to be in accordance with *Pt 6, Ch 1 Control Engineering Systems*, as applicable. The connection of, and the electrical load transfer to and from, an external electrical power supply are only to be controlled on board using shipboard arrangements.

5.1.2 External control of ship equipment may only be provided when in accordance with *Pt 7, Ch 13, 5.1 General 5.1.5*. Otherwise, external arrangements may be used to send requests for action to ship personnel for consideration.

5.1.3 Integration or connection with external, control, alarm and safety systems is to be 'fail-safe'.

5.1.4 The effects of failure of control, alarm and safety system and data communication link connections are to be documented along with resulting failure responses in the submission required by *Pt 7, Ch 13, 1.4 Plans and information 1.4.6*.

5.1.5 Details of proposals that would involve external control of ship equipment to respond to potentially hazardous situations detected externally are to be submitted for consideration. Provided that the arrangements are considered to be in accordance with the provisions of an acceptable and relevant standard, the following external control functions may be permitted:

- initiation of load reductions;
- initiation of electrical load transfer to ship sources of electrical power; and
- initiation of Emergency Shutdown.

5.1.6 The connection power circuit is to be isolated, and for high-voltage connections connected to earth so that it is discharged and so maintained that it is safe to touch, until the connections necessary for safe and effective operation are correctly established, including control, alarm and safety system and data communication link connections.

5.1.7 Following the correct establishment of the necessary connections in accordance with *Pt 7, Ch 13, 5.1 General 5.1.6*:

- where applicable, the connection power circuit may be disconnected from earth; and arranged such that only then
- may the request to make the external power supply connection points live described in *Pt 7, Ch 13, 5.1 General 5.1.8* be sent.

5.1.8 Ship control system arrangements are to be provided to request the external electrical power supply conductors to be:

- where applicable, disconnected from earth; and then
- made live up to the connection points.

5.1.9 An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply upon failure of arrangements required to maintain ready availability in accordance with *Pt 7, Ch 13, 2.1 General requirements 2.1.3* (for example pre-heating).

5.1.10 Additional alarms with their associated safeguards are indicated in *Table 13.5.1 Additional alarms and associated safeguards*. These are in addition to those required by other Parts of the Rules.

5.1.11 Means are to be provided to allow testing of control, alarm and safety system connections with external arrangements, including operation of Emergency Shutdown facilities, before electrical connection to an external power supply.

5.1.12 If, depending upon the in-port shipboard work organisation, no machinery control stations are continuously attended while connected to an external power supply, then alarm transfer arrangements that activate an audible indication to warn relevant duty personnel of alarm initiation may be accepted. An audible warning from any portable devices is to be provided in the event of loss of the wireless link.

5.2 Connection Equipment control and monitoring

5.2.1 Connection Equipment is to be capable of unattended operation under normal operating conditions after correct application of the connection. Remote indication of active ship equipment faults at a machinery control station that is attended when connected to an external electrical power supply is to be provided. Details of arrangements that involve periodic attendance to inspect and adjust Connection Equipment may be submitted for consideration.

5.2.2 A control station is to be provided locally to Connection Equipment cable reel, cranes and gantries that permits identification of faults and permits safe and effective supervision and control of this equipment in the foreseeable environmental conditions.

5.2.3 A fixed means of two-way voice communication with a machinery control station that is attended when connected to an external electrical power supply is to be provided at the control station required by *Pt 7, Ch 13, 5.2 Connection Equipment control and monitoring 5.2.2*.

Table 13.5.1 Additional alarms and associated safeguards

Item	Alarm	Note
Presence of voltage on connections		Indicators in accordance with <i>Pt 7, Ch 13, 3.1 General 3.1.9</i> .
Transfer of load	Time limit exceeded	Return to previous operating state to be indicated, see <i>Pt 7, Ch 13, 4.1 Electrical Load Transfer 4.1.5</i> .
Ship power restoration	Activation	See <i>Pt 7, Ch 13, 4.5 Ship power restoration 4.5.2</i> .
Arrangements to ensure main and auxiliary machinery availability	Failure	When shut down. See <i>Pt 7, Ch 13, 5.1 General 5.1.9</i> .
Applied connection equipment status	Changed	Indication to be provided also. See <i>Pt 7, Ch 13, 5.2 Connection Equipment control and monitoring 5.2.4</i> and <i>Pt 7, Ch 13, 5.2 Connection Equipment control and monitoring 5.2.5</i> .
Connection equipment	Close proximity to water level	See <i>Pt 7, Ch 13, 5.2 Connection Equipment control and monitoring 5.2.6</i>

On-shore Power Supplies

Part 7, Chapter 13

Section 5

Heaters and/or ventilation fans	Failure	See <i>Pt 7, Ch 13, 3.2 Connection Equipment 3.2.11</i> and <i>Pt 7, Ch 13, 3.4 Containers 3.4.9</i>
Connection equipment tension	High	Emergency Shut-Down to be activated. See <i>Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.11</i> .
Plug connectors	Withdrawal	
Earth connection, if required. See <i>Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.9</i>	Loss of continuity	
Manual disconnection	Activation	
Plug and socket-outlet, if required. See <i>Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.6</i>	Not in locked position	
Switchgear enclosure mounted socket-outlets	Arc fault detection	

5.2.4 The control station required by *Pt 7, Ch 13, 5.2 Connection Equipment control and monitoring 5.2.2* is to be provided with a means for operators to:

- select manual control; or
- lock equipment in position; or
- where provided, select automatic adjustment.

This status is to be indicated remotely at a machinery control station that is attended when connected to an external electrical power supply.

5.2.5 When the equipment status selection referred to in *Pt 7, Ch 13, 5.2 Connection Equipment control and monitoring 5.2.4* is changed whilst an external electrical power supply is connected, an alarm is to be activated at a machinery control station that is attended when connected to an external electrical power supply.

5.2.6 Where correctly applied connection equipment is not protected from submersion in the water between the ship and shore (e.g. submersible equipment, equipment routing or slack cable prevention by torque control), an alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply when Connection Equipment approaches a situation where it may be submerged in the water between the ship and shore, for instance due to tidal changes. The time between alarm initiation and possible exposure to this water is to be sufficient to allow the equipment to be attended and adjusted prior to exposure to water.

5.3 Emergency Shutdown

5.3.1 The requirements of this sub-Section apply to arrangements for the emergency disconnection of live electrical power from the connection to an external electrical power supply.

5.3.2 Emergency Shutdown facilities are to be provided that, when activated, will instantaneously:

- isolate the connection from ship electrical power supplies; and
- request isolation of the external electrical power supply connection points.

5.3.3 High-voltage Connection Equipment is to be either:

- provided with permanent arrangements for manual discharging and routed to prevent personnel access to live connection cables and connection points by barriers and/or adequate distance(s) under expected operating conditions; or
- automatically discharged so that it is safe to touch with immediate initiation of switching device closure following the isolation from ship and shore electrical power supplies required by *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2*.

5.3.4 For ships that are intended to connect in ports where Connection Equipment may move into a hazardous area associated with the terminal or port area as a result of the ship inadvertently leaving the berthed position (slipping/ breaking of moorings, etc.), this condition is to be included in the Design Statement. The arrangements are to comply with *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.3.(b)* and, additionally, other electrically powered connection equipment that is not intrinsically safe is to be arranged for automatic isolation.

5.3.5 Means are to be provided to detect or predict tension in the external electrical power supply connection cable that activate the Emergency Shutdown facilities described in *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2* before damage occurs.

Where alternative arrangements to tension detection are proposed (automatic break-away release, connectors with shear bolts and pilot lines, connection with ship/shore Emergency Shutdown system, etc.), details are to be submitted for consideration.

5.3.6 To detect and react to the withdrawal of plugs from socket-outlets while power supply connections are live, the Emergency Shutdown facilities described in *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2* are to be activated before the necessary degree of protection is no longer achieved or power connections are broken by the removal of a plug from a connected socket-outlet, including in-line connections.

5.3.7 For high-voltage connection points on board where the means of locking together plugs and socket-outlets required by *Pt 7, Ch 13, 3.3 Connection cables, plugs and socket-outlets 3.3.4* are not interlocked to prevent removal from the locked position when the Connection Equipment power connections are not discharged so that they are safe to touch, the Emergency Shutdown facilities described in *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2* are to be activated when connected plugs are moved from the locked position. Consideration may be given to relaxing this requirement when evidence is submitted which demonstrates that appropriate controls and procedures acceptable to LR are in place to control personnel access plugs and socket-outlets.

5.3.8 Where connection power plugs are connected to socket-outlets mounted on a switchgear enclosure, arrangements are to be provided to activate the Emergency Shutdown facilities described in *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2* in as short a time as practicable in the event of an arc occurring in the enclosure at the rear of the socket-outlets.

5.3.9 Where *Pt 7, Ch 13, 3.1 General 3.1.7.(b)* applies, the Emergency Shutdown facilities described in *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2* are to be activated in the event of loss of earth connection continuity being detected.

5.3.10 Means to manually activate the Emergency Shutdown facilities described in *Pt 7, Ch 13, 5.3 Emergency Shutdown 5.3.2* are to be provided at:

- a machinery control station that is attended when connected to an external electrical power supply;
- in close proximity to the connection cubicle; and
- at the switchboard where the fixed cable from the shore connection cubicle are received.

Additional manual activation facilities may also be provided at other locations where it is considered necessary. The means of activation are to be visible and prominent, prevent inadvertent operation and require a manual action to reset.

5.3.11 An alarm to indicate activation of the Emergency Shutdown is to be provided at a machinery control station that is attended when connected to an external electrical power supply. The alarm is to indicate the cause of the activation. For power supply restoration, see *Pt 7, Ch 13, 4.5 Ship power restoration 4.5.1* to *Pt 7, Ch 13, 4.5 Ship power restoration 4.5.3*.

■ Section 6 Testing, trials and surveys

6.1 General

6.1.1 The testing and trials required by *Pt 7, Ch 13, 6.1 General 6.1.2* to *Pt 7, Ch 13, 6.1 General 6.1.5* are to be successfully completed to the Surveyor's satisfaction before **OPS** notation may be assigned. Where appropriate test facilities cannot be provided, trials are likely to require the additional co-operation of a port facility with a suitable external electrical power supply and the ability to operate the defined services to be supplied during these trials and allow the testing described to be conducted.

6.1.2 Electrical and control engineering equipment is to be surveyed at manufacturer's works and undergo survey and operational trials on board in accordance with the approved test schedules and applicable testing requirements in *Pt 6, Ch 1 Control Engineering Systems* and *Pt 6, Ch 2 Electrical Engineering*.

6.1.3 In addition to *Pt 7, Ch 13, 6.1 General 6.1.2*, the following Connection Equipment, where applicable, is to be surveyed by the Surveyors during manufacture and testing:

- filters;
- converters; and
- slip ring assemblies.

See also *Pt 6, Ch 2, 1.4 Surveys 1.4.6*.

6.1.4 Cable reels, cranes and/or gantry drives for Connection Equipment are to be surveyed and tested in accordance with applicable LR Rules and *Pt 7, Ch 13, 3.2 Connection Equipment 3.2.9.(e)*.

6.1.5 Trials are to be conducted when connected to a compatible external electrical power supply in accordance with *Pt 7, Ch 13, 3.1 General 3.1.10* to demonstrate to the attending Surveyor that the Rules have been complied with in respect of:

- (a) operation of connection management arrangements;
- (b) trials on cable lifting appliances (for example cable reels or cranes) are to be conducted that demonstrate suitability for the maximum mechanical load and duty required by the Defined Operations within the service profile contained in the Design Statement, including connection of extensions or adapters;
- (c) satisfactory performance of the connection and Connection Equipment throughout the Defined Operations, including a run with the defined services to be supplied operational;
- (d) temperature of electrical joints, connections, circuitbreakers and fuses;
- (e) the operation of electrical load transfer arrangements (including Transfer Time Limit setting), electrical system protection and interlocking devices, Emergency Shutdown arrangements and other safety devices and ship power restoration;
- (f) where acceptable type-test evidence is not submitted, connection break-away, see *Pt 7, Ch 13, 3.2 Connection Equipment 3.2.7*;
- (g) voltage regulation when the maximum load is suddenly thrown off and when starting the largest motor connected to the system;
- (h) where more than one external power supply connection can be operated in parallel, satisfactory load sharing at loads up to normal working load; and
- (i) voltage drop is to be measured, where necessary, to verify that this is not in excess of that specified in *Pt 6, Ch 2, 1.8 Quality of power supplies*.

6.1.6 Arrangements are to be:

- examined at Annual Survey; and
- examined and functionally tested whilst connected to an external electrical power supply during the Complete Surveys of machinery or, where this is not practical, within 12 months of the due date of the Complete Surveys of machinery.

This is to include examination of Connection Equipment.

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 14

Section 1

Section

1 Requirements for machinery and engineering systems of unconventional design

■ Section 1

Requirements for machinery and engineering systems of unconventional design

1.1 General - Scope and objectives

1.1.1 Consistent with the aims of the IMO guidelines for Formal Safety Assessment (MSC-MEPC. 2/Circ.12), the requirements of this Section aim to ensure that risks to maritime safety and the environment, stemming from the introduction of machinery or engineering systems of unconventional design, are addressed insofar as they affect the objectives of classification.

1.1.2 The requirements of this section are to be satisfied where:

- (a) machinery is required to be constructed, installed and tested in accordance with Lloyds Register's (hereinafter referred to as LR) Rules and Regulations and for which the corresponding machinery class notation is to be assigned (see *Pt 1, Ch 2, 2.4 Class notations (machinery)*), and,
- (b) the machinery and engineering systems are considered by LR to be of an unconventional design and which, as a result, are not directly addressed by LR's extant Rules and Regulations.

1.1.3 It is to be noted that as well as the requirements of this section, the general requirements of LR's Rules and Regulations are also to be satisfied as far as they are applicable.

1.1.4 Compliance with ISO15288 *Systems Engineering - System Life Cycle Processes* or an acceptable equivalent national standard may be accepted as meeting the requirements of *Pt 7, Ch 14, 1.3 Project Management* to *Pt 7, Ch 14, 1.11 Validation (certification and survey)*.

1.2 Information to be submitted

1.2.1 Information is to be submitted for assessment of compliance with the general requirements of LR's Rules and Regulations, including the general requirements for:

- (a) Machinery, see *Pt 5, Ch 1 General Requirements for the Design and Construction of Machinery*.
- (b) Steam raising plant and pressure vessels, see *Pt 5, Ch 10 Steam Raising Plant and Associated Pressure Vessels*.
- (c) Machinery and ship piping systems, see *Pt 5, Ch 12 Piping Design Requirements* to *Pt 5, Ch 14 Machinery Piping Systems*.
- (d) Control engineering, see *Pt 6, Ch 1 Control Engineering Systems*.
- (e) Electrical engineering see *Pt 6, Ch 2 Electrical Engineering*.
- (f) Materials, see *Rules for the Manufacture, Testing and Certification of Materials, July 2021*.

1.2.2 In addition to the information identified in *Pt 7, Ch 14, 1.2 Information to be submitted 1.2.1*, the information described in *Pt 7, Ch 14, 1.2 Information to be submitted 1.2.3* and *Pt 7, Ch 14, 1.2 Information to be submitted 1.2.4* is also to be submitted for consideration.

1.2.3 General description detailing the extent of the machinery or engineering system, the shipboard services it is to provide, its operating principles, and its functionality and capability when operating in the environment to which it is likely to be exposed under both normal and foreseeable abnormal conditions. The general description is to be supported by the following information as applicable:

- (a) System block diagram.
- (b) Piping and instrumentation diagrams.
- (c) Description of operating modes, including: Start-up, shut-down, automatic, reversionary, manual and emergency.
- (d) Description of safety related arrangements, including: Safeguards, automatic safety systems and interfaces with ships safety systems.
- (e) Description of connections to other shipboard machinery, equipment and systems, including: Electrical, mechanical, fluids and automation.
- (f) Plans of physical arrangements, including: Location, operational access and maintenance access.
- (g) Operating manuals, including:

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 14

Section 1

Instructions for start-up, operation, shut-down, instructions for maintenance, instructions for adjustments to the performance and functionality and details of risk mitigation arrangements.

- (h) Maintenance manuals, including:

Instructions for routine maintenance, repair following failure, disposal of components and recommended spares inventory.

1.2.4 Project process documentation including:

- (a) Project Management Plan, *see Pt 7, Ch 14, 1.3 Project Management.*
- (b) Requirements Definition Document, *see Pt 7, Ch 14, 1.4 Requirements definition.*
- (c) Quality Assurance Plan, *see Pt 7, Ch 14, 1.5 Quality assurance.*
- (d) Design Definition Document, *see Pt 7, Ch 14, 1.6 Design definition.*
- (e) Risk Management Plan, *see Pt 7, Ch 14, 1.7 Risk management.*
- (f) Configuration Management Plan, *see Pt 7, Ch 14, 1.8 Configuration management.*
- (g) Verification Plan, *see Pt 7, Ch 14, 1.9 Verification.*
- (h) Integration Plan, *see Pt 7, Ch 14, 1.10 Integration.*
- (i) Validation Plan, certification and survey, *see Pt 7, Ch 14, 1.11 Validation (certification and survey).*

1.3 Project Management

1.3.1 A project management procedure is to be established in order to define and manage the key project processes. The project processes are to include the processes described in *Pt 7, Ch 14, 1.4 Requirements definition* to *Pt 7, Ch 14, 1.11 Validation (certification and survey)*.

1.3.2 For the entire project, and each of the processes within the project, the project management procedure is to define the following:

- (a) Activities to be carried out.
- (b) Required inputs and outputs.
- (c) Roles of key personnel.
- (d) Responsibilities of key personnel.
- (e) Competence of key personnel.
- (f) Schedules for the activities.

1.4 Requirements definition

1.4.1 A requirements definition procedure is to be established in order to define the functional behaviour and performance of the machinery or engineering system required by individual stakeholders, in the environments to which the machinery or engineering system is likely to be exposed under both normal and foreseeable emergency conditions.

1.4.2 The procedure is to take account of requirements resulting from key stakeholders, including:

- (a) Ship's owner.
- (b) Ship's operator.
- (c) Ship's crew.
- (d) Shipyard.
- (e) Systems integrator.
- (f) Designers.
- (g) Maintenance personnel
- (h) Surveyors
- (i) Manufacturers and suppliers.
- (j) National Administration.
- (k) LR.

1.4.3 The procedure is to take account of requirements resulting from the following influences:

- (a) Ship operations, including:
Underway, manoeuvring, pilotage, docking, alongside and training exercises.
- (b) Ship conditions, including:

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 14

Section 1

Normal operation, abnormal operation, blackout, deadship, fire in a single compartment and flooding of a single compartment.

(c) Environmental conditions, including:

Temperature, humidity, water spray, salt mist, vibration, shock, inclination, electrical fields and magnetic fields.

(d) Applicable provisions, including:

Statutory legislation, classification requirements, international standards, national standards and codes of practice.

(e) Expected users, including:

Multi-national users with a range of national languages and cultures, fatigued users, users without dedicated training, and maintenance and survey personnel.

(f) Design, construction and operational constraints, including:

Effect of particular design decisions or component choices on other aspects of design, risk and production engineering compromises, verification, integration and validation considerations, maintenance and disposal, and changes in use.

1.4.4 The procedure is to specify the functional behaviour and performance requirements and is to identify the source of the requirements.

1.5 Quality assurance

1.5.1 A quality assurance procedure is to be established in order to ensure that the quality of the machinery or engineering system is in accordance with a defined quality management system.

1.5.2 The procedure is to define the specific quality controls to be applied during the project in order to satisfy the requirements of the quality management system.

1.5.3 The quality management system is to satisfy the requirements of ISO9001:2000 *Quality management systems – Requirements*, or an equivalent acceptable National Standard.

1.6 Design definition

1.6.1 A design definition procedure is to be established in order to define the requirements for the design of machinery or an engineering system which satisfies stakeholder requirements, quality assurance requirements and complies with basic internationally recognised design requirements for safety and functionality.

1.6.2 The procedure is to ensure that the design of the machinery or engineering system satisfies:

- (a) Statutory legislation.
- (b) LR's requirements.
- (c) International Standards and Codes of Practice where relevant.

1.6.3 The procedure is to take account of stakeholder requirements, *see Pt 7, Ch 14, 1.4 Requirements definition*.

1.6.4 The procedure is to take account of quality assurance requirements, *see Pt 7, Ch 14, 1.5 Quality assurance*.

1.6.5 The procedure is to ensure that the requirements for the design of major components and subsystems of the machinery or engineering system can be verified before and after integration.

1.6.6 The procedure is to specify the design requirements and is to identify the source of the requirements.

1.6.7 Any deviations from stakeholder requirements are to be identified, justified and accepted by the originating stakeholder.

1.7 Risk management

1.7.1 A risk management procedure is to be established in order to ensure that any risks stemming from the introduction of the machinery or engineering system are addressed, in particular risks affecting:

- (a) The structural strength and integrity of the ship's hull.
- (b) The safety of shipboard machinery and engineering systems.
- (c) The safety of shipboard personnel.
- (d) The reliability of essential and emergency machinery and engineering systems.
- (e) The environment.

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 14

Section 1

1.7.2 The procedure is to consider the hazards associated with installation, operation, maintenance and disposal, both with the machinery or engineering system functioning correctly and following any reasonably foreseeable failure.

1.7.3 The procedure is to take account of stakeholder requirements, see *Pt 7, Ch 14, 1.4 Requirements definition*.

1.7.4 The procedure is to take account of design requirements, see *Pt 7, Ch 14, 1.6 Design definition*.

1.7.5 The procedure is to ensure that hazards are identified using acceptable and recognised hazard identification techniques, and that the effects of the following influences are considered:

(a) Ship operations, including:

Underway, manoeuvring, pilotage, docking, alongside and maintenance, commissioning and trials.

(b) Ship conditions, including:

Normal operation, blackout, dead-ship, fire in a single compartment and flooding of a single compartment.

(c) Modes of operation, including:

Start-up, running, shut-down, automatic, reversionary, manual and emergency.

(d) Environmental conditions, including:

Temperature, humidity, water spray, salt mist, vibration, shock, inclination, electrical fields and magnetic fields.

(e) Dependencies, including:

Power, fuel, air, cooling, heating, data and human input.

(f) Environmental impact, including:

Emissions to air, discharges to water, noise and waste products.

(g) Failures, including:

Human error, supply failure, system, machinery, equipment and component failure, random, systematic and common cause failures.

1.7.6 The procedure is to ensure that risks are analysed using acceptable and recognised risk analysis techniques and that the following effects are considered:

(a) Local effects:

Loss of function, component damage, fire, explosion, electric shock, harmful releases and hazardous releases.

(b) End effects on:

Services essential to the safety of the ship, services essential to the safety of shipboard personnel and services essential to the protection of the environment.

1.7.7 The procedure is to ensure that risks are eliminated wherever possible. Risks which cannot be eliminated are to be mitigated as necessary.

1.7.8 Details of risks, and the means by which they are mitigated, are to be included in the operating manual, see *Pt 7, Ch 14, 1.2 Information to be submitted 1.2.3*.

1.8 Configuration management

1.8.1 A configuration management procedure is to be established in order to ensure traceability of the configuration of the machinery or engineering system, its subsystems and its components.

1.8.2 The procedure is to identify items essential for the safety or operation of the machinery or engineering system (configuration control items) which could foreseeably be changed during the lifetime of the machinery or engineering system, including:

(a) Documentation.

(b) Software.

(c) Sensors.

(d) Actuators.

(e) Instrumentation.

(f) Valves.

(g) Pumps

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 14

Section 1

1.8.3 The procedure is to take account of the design requirements, *see Pt 7, Ch 14, 1.6 Design definition*.

1.8.4 The procedure is to include items used to mitigate risks, *see Pt 7, Ch 14, 1.7 Risk management*.

1.8.5 The procedure is to ensure that any changes to configuration control items are:

- (a) Identified.
- (b) Recorded.
- (c) Evaluated.
- (d) Approved.
- (e) Incorporated.
- (f) Verified.

1.9 Verification

1.9.1 A verification procedure is to be established in order to ensure that subsystems and major components of the machinery or engineering system satisfy their design requirements.

1.9.2 The procedure is to verify design requirements, *see Pt 7, Ch 14, 1.6 Design definition*.

1.9.3 The procedure is to identify the requirements to be verified, the means by which they are to be verified, and the points in the project at which verification is to be carried out.

1.9.4 The procedure is to be based on one or a combination of the following activities as appropriate:

- (a) Design review.
- (b) Product inspection.
- (c) Process audit.
- (d) Product testing.

1.10 Integration

1.10.1 An integration procedure is to be established in order to ensure that the machinery or engineering system is assembled in a sequence which allows verification of individual subsystems and major components following integration in advance of validating the entire machinery or engineering system.

1.10.2 The procedure is to take account of the verification requirements, *see Pt 7, Ch 14, 1.9 Verification*.

1.10.3 The procedure is to identify the subsystems and major components, the sequence in which they are to be integrated, the points in the project at which integration is to be carried out, and the points in the project at which verification is to be carried out.

1.11 Validation (certification and survey)

1.11.1 A validation procedure is to be established in order to ensure the functional behaviour and performance of the machinery or engineering system meets with its functional and performance requirements.

1.11.2 The procedure is to validate stakeholder requirements, *see Pt 7, Ch 14, 1.4 Requirements definition*.

1.11.3 The procedure is to validate arrangements required to mitigate risks, *see Pt 7, Ch 14, 1.7 Risk management*.

1.11.4 The procedure is to validate the traceability of the configuration control items, *see Pt 7, Ch 14, 1.8 Configuration management*.

1.11.5 The procedure is to identify the requirements to be validated, the means by which they are to be validated and the points in the project at which validation is to be carried out, including:

- (a) Factory acceptance testing.
- (b) Integration testing.
- (c) Commissioning.
- (d) Sea trials.
- (e) Survey.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 1

Section

- 1 **General requirements**
- 2 **Construction and installation**
- 3 **Refrigerating machinery and refrigerant storage compartment arrangements**
- 4 **Refrigerant detection systems**
- 5 **Control and monitoring and electrical power arrangements**
- 6 **Personnel safety equipment and systems**
- 7 **Testing and trials**

■ Section 1 General requirements

1.1 General

1.1.1 This Chapter states the requirements for ships having centralised refrigeration systems, designed to reject heat from refrigerated stores or from the air-conditioning and ventilation arrangements fitted to both passenger and crew accommodation spaces and are in addition to the relevant requirements of *Pt 5 Main and Auxiliary Machinery* and *Pt 6 Control, Electrical, Refrigeration and Fire*.

1.1.2 The requirements, which are optional, cover arrangements, equipment, and systems necessary for provision stores and air-conditioning arrangements as defined in *Pt 7, Ch 15, 1.1 General 1.1.3* and *Pt 7, Ch 15, 1.1 General 1.1.4*.

1.1.3 The refrigeration system is to include the refrigeration compressor(s), condenser(s), evaporator(s), direct expansion air handling and fan coil units, interconnecting primary refrigerant piping system and fittings.

Note For the purpose of these Rules, the term primary refrigerant system, unless otherwise stated, applies to primary refrigerant systems and secondary refrigerant systems containing volatile refrigerants.

1.1.4 These requirements are intended to mitigate risks associated with the safety of refrigeration and air-conditioning machinery, and do not cover air distribution ductwork, chilled water systems or the calculation and verification of air flow rates and cooling loads within the air conditioned or refrigerated spaces. The method used to calculate the capacity of the air-conditioning refrigeration equipment is the responsibility of the Shipbuilder and Owner and should be in accordance with a recognised code or standard such as ISO 7547:2002 *Ships and marine technology – Air-conditioning and ventilation of accommodation spaces – Design conditions and basis of calculations* or, ASHRAE 26-1996(RA2006) *Mechanical Refrigeration and Air-Conditioning Installations Aboard Ship*.

1.1.5 Ships complying with the applicable requirements of this Chapter will be eligible for the optional machinery class notation **RPA** (Refrigeration Machinery for Provision Stores and Air-conditioning).

1.2 Plans and information

1.2.1 The following plans and particulars, as applicable, and any others which may be specially requested for the refrigerating plant and systems, are to be submitted in triplicate for approval, before construction is commenced:

- (a) Schematic plans, including full particulars of piping and instrumentations, for:
 - (i) primary and secondary refrigerant systems containing a volatile fluid;
 - (ii) air cooler defrosting arrangements; and
 - (iii) condenser cooling water systems.
- (b) Detailed dimensioned plans and material specifications for:
 - (i) reciprocating compressor crankshaft and crankcase, where exposed to refrigerant pressure;
 - (ii) rotary-type compressor rotors and casing;
 - (iii) condensers, both shell and tube, and plate type;

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 2

- (iv) evaporators, both shell and tube, and plate type;
- (v) air coolers or arrangement of air cooling pipe grids and construction method;
- (vi) liquid receivers;
- (vii) oil separators; and
- (viii) any other pressure vessels or heat exchangers containing primary refrigerants, *see Pt 5, Ch 11, 6.1 General*.
- (c) General arrangement of refrigerating machinery compartments in elevation and plan, showing location and arrangement of the plant, ventilation details and location of temperature sensors and refrigerant vapour detectors.
- (d) Details of automatic controls, alarms and safety systems, *see Pt 6, Ch 1, 1 General requirements*.
- (e) Details of primary refrigerant level indicators.
- (f) Capacity calculations for pressure relief valves and/or bursting discs, and inlet and discharge pipework pressure drop calculations.
- (g) Programme of tests to be conducted on completion of the installation, *see Pt 7, Ch 15, 7 Testing and trials*.

1.2.2 In addition to the applicable requirements detailed in *Pt 7, Ch 15, 1.2 Plans and information 1.2.1*, the following information is also to be submitted for air-conditioning refrigeration equipment:

- (a) Details of direct expansion fan coil units (FCUs).
- (b) Details of cooling coils, fitted to air handling units (AHUs) that contain primary refrigerant.
- (c) General arrangement drawing showing the location of the air-conditioning refrigeration equipment, direct expansion FCUs and AHUs throughout the ship.
- (d) Details of pressure testing procedures for the refrigeration equipment.

1.2.3 Plans showing the general arrangement of refrigeration plant compartments, together with a description of the equipment and arrangements installed for isolation and distribution of ventilation air and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms and control stations.

1.2.4 A statement of the intended design system capacity for the intended operating conditions for verification purposes at the trials required by *Pt 7, Ch 15, 7.2 Trials 7.2.1*.

1.2.5 A schedule of testing and trials to demonstrate that systems are capable of operating as designed and as required by *Pt 7, Ch 15, 7 Testing and trials*.

1.2.6 Operating manuals are to be submitted for information. The manuals are to include the following information:

- (a) Particulars and a description of the systems.
- (b) Operating instructions for the equipment and systems.
- (c) Maintenance instructions for the installed arrangements.

1.2.7 Evidence that the required performance of refrigeration systems, pump and fan equipment is capable of being maintained under ambient and inclination operating conditions defined in *Pt 5, Ch 1, 3.5 Ambient reference conditions* and *Pt 5, Ch 1, 3.6 Ambient operating conditions* is to be provided by the manufacturer.

■ Section 2

Construction and installation

2.1 Materials

2.1.1 The selection of materials for piping systems in provision store refrigeration systems is to take account of the following:

- (a) The pressures and temperatures of the refrigerant fluids.
- (b) Locations of systems and equipment.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static pressure conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) Refrigerant flammability and toxicity.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 2

2.1.2 Pipes, valves and fittings are in general to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable subject to the restrictions in *Pt 5, Ch 12, 5 Plastic pipes*.

2.1.3 Where applicable, the piping systems are to comply with the requirements of *Pt 5, Ch 12 Piping Design Requirements*.

2.2 Equipment – Selection and installation

2.2.1 Pressure vessels in provision store and air-conditioning refrigeration systems are to be in accordance with *Pt 5, Ch 11 Other Pressure Vessels*.

2.2.2 Valves and flexible hose lengths are to comply with the relevant requirements of *Pt 5, Ch 12 Piping Design Requirements*.

2.2.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.

2.2.4 Suitable means for expansion are to be made, where necessary, in each range of pipes.

2.2.5 Suitable protection is to be provided for all pipes and equipment situated where they are liable to mechanical damage.

2.2.6 All moving parts are to be provided with guards to minimise danger to personnel.

2.2.7 Primary refrigerant pipework, serving AHUs and FCUs, which pass through bulkheads and deckheads is to comply with the requirements of SOLAS Chapter II-2, 3 *Penetrations in fire-resisting divisions and prevention of heat transmission*.

2.3 Valves and relief devices

2.3.1 Valves are to be fitted in places where they are readily accessible at all times.

2.3.2 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by a locking wire with a lead seal or similar arrangement, see also *Pt 7, Ch 15, 2.4 Refrigerant systems 2.4.4*.

2.4 Refrigerant systems

2.4.1 The primary refrigerants ammonia, hydrocarbons or carbon dioxide shall not be used in direct expansion FCUs located in accommodation spaces. The use of these refrigerants in machinery spaces, such as a separate AHU compartment, may be accepted subject to suitable safety arrangements being provided to the satisfaction of Lloyd's Register (hereinafter referred to as LR).

2.4.2 Compartments containing refrigeration plant are to be provided with refrigerant gas leak detectors with an alarm. See *Pt 7, Ch 15, 4 Refrigerant detection systems*.

2.4.3 The design of refrigeration systems is to permit maintenance and repair without unavoidable loss of refrigerant to atmosphere. To minimise refrigerant release to the atmosphere, refrigerant recovery units are to be provided to allow evacuation of a system prior to maintenance.

2.4.4 Refrigeration systems are to be provided with relief devices which are arranged with sufficient margins to avoid circumstances that would allow an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that overpressure due to fire conditions can be safely relieved.

2.4.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The refrigerant flow capacity of the valve or disc is to exceed the full load compressor capacity for the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

2.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of a stop or automatic control or check valve is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device. Pressure vessels that are connected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any pressure vessel.

2.4.7 Omission of one of the specified relief devices and changeover device, as required by *Pt 7, Ch 15, 2.4 Refrigerant systems 2.4.6*, will be accepted where:

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 2

- (a) vessels are of less than 300 litres internal gross volume; or
- (b) vessels discharge into the low pressure side of the system by means of a relief valve.

2.4.8 Sections of systems and components that could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.

2.4.9 Where any hermetic or semi-hermetic compressor has the electric motor cooled by the circulating refrigerant, the following arrangements are to be provided:

- (a) Refrigeration circuits are to contain no more than one hermetic or semi-hermetic compressors.
- (b) Each compressor motor is to be fitted with a thermal cutout device to protect the motor against overheating.
- (c) Each refrigerant circuit is to contain a suitable arrangement to allow debris or contaminants from a motor failure to be removed.
- (d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of *Pt 5, Ch 11 Other Pressure Vessels* and *Pt 5, Ch 17 Requirements for Fusion Welding of Pressure Vessels and Piping* as applicable. Plans are to be submitted for consideration as required by *Pt 5, Ch 11, 1.6 Plans*.

2.5 Air handling unit(s) (AHUs) for air-conditioning systems

2.5.1 Evaporator coils as fitted to direct expansion AHUs are to be considered for approval and plans are to be submitted, *see also Pt 7, Ch 15, 1.2 Plans and information 1.2.2*. All other equipment fitted to an AHU, such as air filtration, dehumidification, heating and humidification systems are outside the scope of these Rules and are the responsibility of the Shipyard and Owner.

2.5.2 Each AHU is to be provided with suitable drip trays and drainage arrangements to remove any condensate which may form.

2.5.3 The installation arrangements of AHUs are to be such as to allow sufficient space for the withdrawal and replacement of the refrigerant cooling coil.

2.6 Air coolers and cooling grids for provision store refrigeration systems

2.6.1 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.

2.6.2 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. When a store operates at temperatures at, or lower than 0°C, provision is to be made for the prevention of freezing of the condensate.

2.6.3 The installation arrangements of air coolers are to be such that when the refrigerated spaces are loaded with provisions, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.

2.6.4 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

2.7 Design pressures

2.7.1 The design pressure of the system will be regarded as equal to its maximum working pressure, *see Pt 7, Ch 15, 2.7 Design pressures 2.7.5*.

2.7.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No pressure relief valve or other protective device is to be set to a pressure higher than the maximum working pressure.

2.7.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure side of the system. For carbon dioxide design pressures, *see Pt 7, Ch 15, 2.7 Design pressures 2.7.6*.

2.7.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be determined from $1,11 \times P_b$, where P_b is an allowance for the compressor high pressure cut-out. P_b is to be not less than to $1,11 \times P_a$, where P_a is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure of the refrigerant at plus 46°C.

2.7.5 Design pressures applicable to refrigerants are to be not less than the values given in *Table 15.2.1 Design pressure limits* when condensers are sea-water cooled. The design pressure for other refrigerants and condensing arrangements is to be agreed with LR.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 2

Table 15.2.1 Design pressure limits

Refrigerant	Pressure, (MPa)	
	High	Low
R-717		1,72
R-22	2,06	1,67
R-290	1,81	1,47
R-600a	0,64	0,52
R-134a	1,34	1,09
R-407C	2,35	1,9
R-410A	3,45	2,8
R-507A	2,53	2,05
R-404A	2,48	2,01
R-744	See Pt 7, Ch 15, 2.7 Design pressures 2.7.6	
Note In view of increasing world-wide restrictive legislation and phasing out of the HCFC refrigerant R-22, it is recommended that this refrigerant should not be used in new installations.		

2.7.6 The proposed design pressure for a carbon dioxide system is to be stated, taking account of the maximum working pressure and the maximum pressure at rest conditions. Where the maximum pressure at rest condition is maintained by the fitting of a supplementary refrigeration unit, condensing the vapour in a holding vessel, supporting calculation is to be provided to show that this can be undertaken with a local ambient temperature of 45°C. The holding vessel is to be thermally insulated to prevent the operation of the relief devices within a 24 hour period after stopping the supplementary refrigeration unit at an ambient temperature of 45°C and an initial pressure equal to the starting pressure of the refrigeration unit.

2.7.7 Where a carbon dioxide system is designed for hot gas defrosting, due regard is to be given to the possibility of a higher pressure being imposed on the low pressure system. The design pressure for the hot gas defrosting section of the system is to be 10 per cent greater than the maximum pressure experienced during defrosting.

2.8 Insulation materials

2.8.1 Where applicable, having regard to their location and environmental conditions, insulation arrangements are to have:

- (a) materials suitably resistant to fire;
- (b) insulation lining suitably resistant to flame spread;
- (c) effective protection against penetration of water vapour; and
- (d) adequate protection against mechanical damage.

2.8.2 The potential for smoke generation and toxicity of insulation materials is to be in accordance with SOLAS Chapter II-2, Part B, *Regulation 6 - Smoke generation potential and toxicity*.

2.8.3 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted.

2.8.4 Prefabricated panel systems are to be fitted with suitable pressure equalising devices.

2.8.5 All low temperature pipework, valves and fittings are to be provided with suitable thermal insulation. See Pt 6, Ch 3, 4.11 Piping systems 4.11.10.

2.9 Manufacture and certification

2.9.1 Pressure vessels satisfying the conditions listed in Pt 5, Ch 11, 1.6 Plans 1.6.1 are to be constructed in accordance with the requirements of Pt 5, Ch 11 Other Pressure Vessels and Pt 5, Ch 17 Requirements for Fusion Welding of Pressure Vessels and Piping. Plans are to be submitted for consideration as required by Pt 5, Ch 11, 1.6 Plans.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 3

2.9.2 Other equipment, apart from applicable pressure vessels and heat exchangers, used for air-conditioning or provision stores refrigeration systems are not required to be constructed under survey.

2.9.3 All major items of equipment, containing refrigerant, such as compressors, condensers, AHU cooling coils and FCUs shall be supplied with a manufacturer's works certificate providing details of the design and test pressures.

Section 3

Refrigerating machinery and refrigerant storage compartment arrangements

3.1 General

3.1.1 Refrigerating machinery is to be installed in a well ventilated compartment. In general, the arrangements are to be such that all components of the refrigerating machinery can be readily opened up for inspection or replacement. Space is to be provided for the withdrawal and renewal of the tubes in 'shell-and-tube' type evaporators (secondary refrigerant coolers) and condensers. Proposals for alternative arrangements are to be submitted to LR for consideration.

3.1.2 Refrigerating machinery using toxic and/or flammable refrigerants is to be located outside the main machinery space in a separate gastight compartment.

3.1.3 Where the refrigerating machinery is located in a separate gastight compartment, outside the main machinery space, this compartment is to be equipped with effective mechanical ventilation to provide 30 air changes per hour based upon the total volume of the space. The mechanical ventilation system is to have two methods of control, one of which is to be operable from outside the compartment.

3.1.4 Openings for pipes, electrical cables and other fittings in bulkheads and decks are to be fitted with gastight seals.

3.2 Gas storage compartments

3.2.1 Portable steel cylinders containing reserve supplies of refrigerant are to be stored in a well ventilated compartment reserved solely for this purpose.

3.2.2 The storage compartment is to be provided with a mechanical ventilation system providing 10 air changes per hour.

3.2.3 The storage compartment is to be provided with a suitable vapour detection system, *see Pt 7, Ch 15, 4 Refrigerant detection systems*.

3.2.4 The storage compartment is to be provided with suitable water drainage arrangements not connected with the main machinery spaces.

3.2.5 Steel storage cylinders are to be of an approved type and are to be filled to a level suitable for an ambient temperature of plus 46°C.

3.2.6 The storage compartment is to be provided with racks to facilitate secure stowage of the cylinders.

3.3 Pressure testing at manufacturers' works

3.3.1 Components intended for use with a primary refrigerant are to be subject to pressure testing procedures as detailed in *Table 15.3.1 Test pressure*.

Table 15.3.1 Test pressure

Component	Test pressure, (MPa)	
	Pressure test	Tightness test
(1) Pressure vessels	<i>See Pt 5, Ch 11 Other Pressure Vessels</i>	1,0p
(2) Compressor cylinders/crankcase/casing	1,5p	1,0p
(3) Valves and fittings	2,0p	1,0p

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 4

(4) Pressure piping, fabricated. headers, air coolers, etc.	1,5p	1,0p
Note p is the design pressure as defined in Pt 7, Ch 15, 2.7 Design pressures.		

3.3.2 Component pressure tests are to be hydraulic or where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.

3.3.3 Component tightness tests are to be carried out only after completion of satisfactory pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.

3.3.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure which, in no case is to be less than 0,35 MPa.

3.4 Pressure test after installation on board ship

3.4.1 For primary refrigerant piping welded in place, pressure tests of the welds are to be carried out at a test pressure of 1,5p. This will normally take the form of a pneumatic test (see Pt 7, Ch 15, 3.4 Pressure test after installation on board ship 3.4.2) since hydraulic testing media such as water are not acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.

3.4.2 Pneumatic pressure tests are to be carried out using a suitable inert gas.

Note Where pneumatic testing is used, adequate safety precautions recognising the hazards involved should be observed to prevent danger to personnel and to minimise risk to property.

3.4.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by Pt 7, Ch 15, 3.4 Pressure test after installation on board ship 3.4.1 and Pt 7, Ch 15, 3.4 Pressure test after installation on board ship 3.4.2 may be omitted provided non-destructive examination has been carried out by an approved operator to the satisfaction of LR and in accordance with the requirements of Pt 5, Ch 17, 6 Non-Destructive Examination.

3.4.4 After completion of the test required by Pt 7, Ch 15, 3.4 Pressure test after installation on board ship 3.4.1, Pt 7, Ch 15, 3.4 Pressure test after installation on board ship 3.4.2 or Pt 7, Ch 15, 3.4 Pressure test after installation on board ship 3.4.3, a tightness test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the surveyor.

3.4.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure which, in no case is to be less than 0,35 MPa.

Section 4

Refrigerant detection systems

4.1 General

4.1.1 A fixed refrigerant detection system is to be provided in the refrigerating machinery compartment or space and ventilation outlet ducts when the ventilation system is shared with other compartments.

4.1.2 The alarm system is to comply with the requirements of Pt 6, Ch 1 Control Engineering Systems and, as a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and at a high-level concentration corresponding to the refrigerant's safe occupational level.

4.1.3 Detection equipment is to be so designed that it may be readily tested and calibrated; any failure of the equipment is to initiate an alarm.

4.1.4 The location of the detectors is to be determined relative to the layouts of the individual compartments and machinery spaces and are to be indicated in the plan submission.

4.1.5 Audible and visual alarms are to be activated, located both inside and outside the affected space. The alarms are to be readily identifiable and be visible and audible in all locations within the space housing the refrigeration equipment.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 5

■ Section 5

Control and monitoring and electrical power arrangements

5.1 General

- 5.1.1 Control engineering arrangements are to comply with *Pt 6, Ch 1 Control Engineering Systems* as applicable.
- 5.1.2 All cooling and secondary refrigerant pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at each control station.
- 5.1.3 The power to all independently driven ventilation fans is to be capable of being stopped from position(s) outside the fire boundary which will remain readily accessible in the event of fire occurring in any space, as well as from the local control panel.
- 5.1.4 Electrical engineering arrangements are to comply with *Pt 6, Ch 2 Electrical Engineering*.
- 5.1.5 Refrigeration compressors are to be provided with the following instrumentation and automatic shutdowns:
- (a) Indication of suction pressure (saturated temperature), including intermediate stage when applicable.
 - (b) Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
 - (c) Indication of lubricating oil pressure.
 - (d) Indication of cumulative running hours (screw compressors).
 - (e) Automatic shutdown in the event of low lubricating oil pressure.
 - (f) Automatic shutdown in the event of high discharge pressure, see also *Pt 7, Ch 15, 5.1 General 5.1.13*.
 - (g) Automatic shutdown in the event of low suction pressure.
- 5.1.6 For refrigeration compressors greater than 25 kW, the following instrumentation, additional to that required by *Pt 7, Ch 15, 5.1 General 5.1.5*, is to be provided:
- (a) Indication of lubricating oil temperature.
 - (b) Indication of condenser cooling water outlet temperature.
 - (c) Indication of cumulative running hours (reciprocating compressors).
 - (d) Indication of suction and discharge temperatures.
- 5.1.7 Alarms are to be initiated in the event of the following fault conditions with refrigeration compressors:
- (a) High discharge pressure.
 - (b) Low suction pressure.
 - (c) Low oil pressure.
 - (d) High discharge temperature.
 - (e) High oil temperature.
 - (f) Motor shutdown.
- 5.1.8 Refrigeration plants are to be provided with the following alarms as applicable:
- (a) Failure of condenser cooling water pumps.
 - (b) High condenser cooling water outlet temperature.
 - (c) Failure of air cooler fans.
 - (d) High and low refrigerated air delivery temperatures.
 - (e) High secondary refrigerant temperatures.
 - (f) Failure of secondary refrigerant pump.
 - (g) Low level in secondary refrigerant header tank.
- 5.1.9 Where the air-conditioning/refrigerating system is fitted with automatic or remote controls, so that, under normal operating conditions, no manual intervention by the operators is required, it is to be provided with the alarms required by *Pt 7, Ch 15, 5.1 General 5.1.6* to *Pt 7, Ch 15, 5.1 General 5.1.8* in accordance with the relevant requirements of *Pt 6, Ch 1 Control Engineering Systems*.
- 5.1.10 Where more than one compressor is fitted, the control sequence is to be such as to allow one machine to stop in the event of a reduction in cooling duty. Provision is to be made to allow selection of the lead machine to equalise running hours.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 6

5.1.11 To allow the equipment to be isolated from the power supply in the event of a failure or refrigerant leak, refrigeration compressors and AHUs are to be fitted with local emergency stop switches.

5.1.12 AHUs are to be provided with the following instrumentation as a minimum:

- (a) Indication of primary refrigerant outlet pressure and temperature; and
- (b) Indication of outlet air temperature.

5.1.13 Compressors are to be provided with automatic shutdown in the event of high discharge pressure. For refrigeration systems where the maximum working pressure is less than or equal to 4 MPa, the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,9 of the maximum working pressure. For refrigeration systems where the maximum working pressure is greater than 4 MPa, the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,95 of the maximum working pressure.

Section 6

Personnel safety equipment and systems

6.1 Personnel safety equipment

6.1.1 Access doors to the refrigerated spaces are to open outwards, alternatively sliding doors may be used where the door is external to the space.

6.1.2 Access ways to the refrigerated spaces are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.

6.1.3 Access ways and refrigerated compartments are to be provided with an independent lighting system in accordance with the requirements of *Pt 6, Ch 2, 5.7 Lighting circuits 5.7.2* and *Pt 6, Ch 2, 5.7 Lighting circuits 5.7.4*, with the means of locking the switches in the 'on' position.

6.1.4 Arrangements are to be such that means are provided for both opening the room door(s) and sounding the alarm required by *Pt 7, Ch 15, 6.2 Personnel warning systems 6.2.2* from inside refrigerated spaces.

6.1.5 Where ammonia is used in refrigerating systems, the following items of safety equipment are to be provided as a minimum, and positioned in accessible protected storage (e.g. locked glass fronted cabinets) located outside the machinery compartment:

- (a) Two sets of ammonia protective clothing (including helmet, boots and gloves).
- (b) Two portable battery powered hand lamps (to be of certified safe-type).
- (c) Two sets of self-contained breathing apparatus (compressed air).
- (d) Two full face mask respirators.
- (e) Two fire-resistant life-lines.
- (f) Two firemen's axes.
- (g) Two heavy duty adjustable spanners.
- (h) Two wheel wrenches.
- (i) Irrigation facilities or eye wash bottles containing an eye wash solution, distilled water or non-carbonated mineral water.
- (j) Hand or foot-operated douches providing a copious supply of clean water, located outside the compartment's doors.

6.2 Personnel warning systems

6.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.

6.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the system is to alarm and must indicate their well-being by accepting the warning.

6.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.

6.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 15

Section 7

6.2.5 In the event that the crew member(s) fails to respond and accept the warning within an agreed specified time, the system is to immediately initiate an alarm on the bridge and at the main control station, or subsidiary control stations as appropriate. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.

6.2.6 The system is to comply with the relevant requirements of *Pt 6, Ch 1 Control Engineering Systems*.

■ Section 7

Testing and trials

7.1 Testing

7.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. See *Pt 5, Ch 11 Other Pressure Vessels* and *Pt 5, Ch 12, 8 Hydraulic tests on pipes and fittings*.

7.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.

7.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.

7.1.4 Testing is to cover the following items:

- (a) Verification of control, alarm and safety systems.
- (b) Simulation tests for failure of refrigeration equipment, to verify correct functioning of alarms and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control for refrigeration systems.

7.2 Trials

7.2.1 Acceptance trials, as stipulated in this Section, are to be conducted. It is to be demonstrated that the provision store or air-conditioning refrigerating system capacity meets the design duty. As far as is practicable, the trials are to represent the operating conditions that will be encountered in service. For example, the condenser cooling water flow should be restricted so that the compressor discharge pressure is at the design value.

Section

- 1 **Towing winch emergency release systems - goal-based framework**
- 2 **Towing winch emergency release systems - scope and definitions**
- 3 **Emergency release system requirements**
- 4 **Validation of requirements for emergency release systems**

■ Section 1 Towing winch emergency release systems - goal-based framework

1.1 Goal-based framework

1.1.1 The purpose of this Section is to present a goal-based approach to the requirements for towing winch emergency release systems provided on towing winches that are used for towing ships within close quarters, ports or terminals, including those ships normally not intended for towing operation in the transverse direction.

1.1.2 The goals, functional requirements and performance requirements listed herein relate to design, construction and testing of the emergency release system.

1.1.3 The list of goals is as follows:

- (a) The towing winch emergency release system is designed, constructed and tested through life to release loads safely, if necessary, in the event of an incident.
- (b) The towing winch emergency release system is designed, constructed and tested in accordance with appropriate documented requirements.

1.1.4 The list of functional requirements is as follows:

- (a) The emergency release is to operate under all normal and reasonably foreseeable abnormal conditions.
- (b) The towline load is to be released in a controlled manner
- (c) Control systems are to function in a safe manner in all foreseen operational conditions.
- (d) Activation of the emergency release shall not expose the crew to any additional hazard.
- (e) Towline load is to be released quickly enough to prevent capsize of the tug.
- (f) The release system is to operate across the full range of possible towline loads, fleet angles and ship heel angles.
- (g) The emergency release control system is to be designed to 'fail-safe', see Pt 6, Ch 1, 2.5 Control systems, general requirements 2.5.3.
- (h) Necessary information and instructions to maintain and test the emergency release system are to be available.
- (i) Emergency winch release is to be tested to demonstrate functionality and correct operation at appropriate intervals.

1.1.5 The list of performance requirements is as follows:

- (a) The emergency release is to operate at 100 per cent of the maximum design load.
- (b) Where additional sources of energy are provided, to effect emergency release of the towline in the event of a black out, they are to be sufficient to allow for at least three attempts to release the towline and/or hold the brake open for sufficient time to release the full length of the towline or five minutes, whichever is lesser.
- (c) Towline load required to rotate the winch drum once emergency release has been activated is to be no greater than:
 - the lesser of five tonnes or five per cent of the maximum design load when two layers of towline are on the drum; or
 - 15 per cent of the maximum design load where it is demonstrated that this resistance to rotation does not exceed 25 per cent of the force that will result in listing sufficient for the immersion of the lowest unprotected opening.
- (d) The towline release is to be controlled to prevent the towline from becoming jammed.
- (e) Control systems are to provide all necessary alarms to alert the crew in the event of failure affecting capability of the emergency release system.
- (f) Arrangements of emergency release system controls are to prevent accidental or non-deliberate activation of the release system.

- (g) Operation of the emergency release is to be possible from the bridge and from safe locations on the deck.
- (h) The load is to be released within a maximum of three seconds.
- (i) A weak link or similar arrangement is to be provided connecting the towline to the winch drum.
- (j) All locations from where the emergency release can be operated are to have a full view of the towing winch and surrounding area.

1.2 LR accepted solution for towing winch emergency release systems in satisfying the goal-based framework

1.2.1 For LR accepted solutions to satisfactorily meet the goal-based framework see *Pt 7, Ch 16, 2 Towing winch emergency release systems - scope and definitions* to *Pt 7, Ch 16, 4 Validation of requirements for emergency release systems*.

1.2.2 The application of the prescriptive content in this Chapter in its entirety is considered to satisfy the functional and performance requirements of this chapter as applied to towing winch emergency release systems.

1.2.3 Alternative proposals for meeting the goal-based framework of this Section will be specially considered.

■ Section 2

Towing winch emergency release systems - scope and definitions

2.1 Scope

2.1.1 The requirements of this Chapter apply to winch emergency release systems provided on towing winches that are used for towing ships within close quarters, ports or terminals.

2.1.2 The requirements of this Chapter are not applicable to towing winches on board ships used solely for long distance ocean towage, anchor handling or similar offshore activities.

2.1.3 See *Pt 4, Ch 3, 7 Towing arrangements* for requirements for towing winches and associated equipment.

2.2 Definitions

2.2.1 **Emergency release system** refers to the mechanism and associated control arrangements that are used to release the load on the towline in a controlled manner under both normal and blackout conditions.

2.2.2 **Maximum design load** is the maximum load that can be held by the winch as defined by the manufacturer (the manufacturer's rating).

2.2.3 **Fleet angle** is the angle between the applied load (towline force) and the towline as it is wound onto the winch drum, see *Figure 16.2.1 Towline 'fleet angle'*.

Figure 16.2.1 Towline 'fleet angle'

■ Section 3

Emergency release system requirements

3.1 General requirements

- 3.1.1 The in-board end of the towline is to be attached to the winch drum with a weak link or similar arrangement that is designed to release the towline at low load.
- 3.1.2 All towing winches are to be fitted with an emergency release system.
- 3.1.3 Where required for testing the winch, adequately sized strong points are to be provided on deck.

3.2 Emergency release system operation

- 3.2.1 The emergency release system is to operate across the full range of towline loads, fleet angles and ship heel angles under all normal and reasonably foreseeable abnormal conditions (including, but not limited to vessel electrical failure, variable towline load (for example due to high strain rate loadings i.e. 'snap loads'), etc.).
- 3.2.2 The emergency release system shall be capable of operating with towline loads up to at least 100 per cent of the maximum design load.
- 3.2.3 The emergency release system is to function as quickly as is reasonably practicable and within a maximum of three seconds after activation.
- 3.2.4 The emergency release system is to allow the winch drum to rotate and the towline to pay out in a controlled manner such that, when the emergency release system is activated, there is sufficient resistance to rotation to avoid uncontrolled unwinding of the towline from the drum. Spinning (free, uncontrolled rotation) of the winch drum is to be avoided, as this could cause the towline to get jammed and disable the release function of the winch.
- 3.2.5 Once the emergency release is activated, the towline load required to rotate the winch drum is to be no greater than:
 - (a) the lesser of five tonnes or five per cent of the maximum design load when two layers of towline are on the drum; or
 - (b) 15 per cent of the maximum design load where it is demonstrated that this resistance to rotation does not exceed 25 per cent of the force that will result in listing sufficient for the immersion of the lowest unprotected opening. Unprotected openings include openings fitted with closing appliances that must remain open for operational reasons.
- 3.2.6 Emergency release of the towline is to be possible in the event of a blackout. For this purpose, where additional sources of energy are required, such sources are to comply with *Pt 7, Ch 16, 3.2 Emergency release system operation 3.2.7*.
- 3.2.7 The sources of energy required by *Pt 7, Ch 16, 3.2 Emergency release system operation 3.2.6* are to be sufficient to achieve the most onerous of the following conditions (as applicable):
 - (a) Sufficient for at least three attempts to release the towline (i.e. three activations of the emergency release system). Where the system provides energy for more than one winch, it is to be sufficient for three activations of the most demanding winch connected to it.
 - (b) Where the winch design is such that the drum release mechanism requires continuous application of power (e.g. where the brake is applied by spring tension and released using hydraulic or pneumatic power), sufficient power is to be provided to operate the emergency release system (e.g. hold the brake open and allow release of the towline) in the event of a blackout situation for a minimum of five minutes. This may be reduced to the time required for the full length of the towline to feed off the winch drum at the load specified in *Pt 7, Ch 16, 3.2 Emergency release system operation 3.2.5* if this is less than five minutes.

3.3 Emergency release control system

- 3.3.1 Emergency release operation must be possible from the bridge and from the winch control station on deck. The winch control station on deck is to be in a safe location. A position in close proximity to the winch is not regarded as a 'safe location', unless it is documented that the position is, at least, protected against towline break or winch failure.
- 3.3.2 The emergency release control is to be located close to an emergency stop button for winch operation, if provided, and shall be clearly identifiable, clearly visible, easily accessible and positioned to allow safe operability.
- 3.3.3 The emergency release function is to take priority over any emergency stop function. Activation of the winch emergency stop from any location is not to inhibit operation of the emergency release system from any location.

3.3.4 Emergency release system control buttons are to require positive action to cancel. The positive action may be made at a different control position from the one where the emergency release was activated. It must always be possible to cancel the emergency release from the bridge regardless of the activation location and without manual intervention on the working deck.

3.3.5 Controls for emergency use are to be protected against accidental activation.

3.3.6 Indications are to be provided on the bridge for all power supply busbar voltage and frequency and/or hydraulic/pneumatic pressure levels related to the normal operation of the emergency release system. Alarms are to activate automatically if any level falls outside of the limits within which the emergency release system is fully operational.

3.3.7 Wherever practicable, control of the emergency release system is to be provided by a hard-wired system, fully independent of programmable electronic systems.

3.3.8 Computer-based systems that operate or may affect the control of emergency release systems are to meet the requirements of *Pt 6, Ch 1, 2.13 Programmable electronic systems - Additional requirements for essential services and safety critical systems*.

■ Section 4

Validation of requirements for emergency release systems

4.1 Documentation

4.1.1 Operation and maintenance procedures for the emergency release system are to be incorporated in the vessel's operations manual.

4.1.2 Components critical for the safe operation of the emergency release system are to be identified by the manufacturer and included in the operations manual on board the vessel.

4.1.3 Instructions for surveys and periodic testing of the emergency release system are to be documented by the manufacturer, agreed with LR and are to be kept on board the ship on which the winch has been installed. The documentation is to be made available to the Surveyor on request.

4.2 Testing and trials

4.2.1 All testing and trials defined within this Section are to be carried out under survey to the satisfaction of the attending Surveyor.

4.2.2 For each emergency release system, the requirements of *Pt 7, Ch 16, 3.2 Emergency release system operation* are to be verified either at the manufacturer's works or as part of the commissioning of the towing winch when it is installed on board. Where verification solely through testing may present a safety hazard, testing may be combined with inspection, analysis or demonstration in agreement with LR.

4.2.3 The performance capabilities and operating instructions of the emergency release system are to be included in the manufacturer's operating manual which is to be made available on board the ship on which the winch has been installed.

4.2.4 The full functionality of each emergency release system fitted is to be tested as part of the shipboard commissioning trials to the satisfaction of the attending Surveyor. Testing may be conducted either during a bollard pull test or by applying the towline load against a strong point on the deck of the tug that is certified to the appropriate load.

4.2.5 Where the performance of the winch in accordance with *Pt 7, Ch 16, 3.2 Emergency release system operation* has previously been verified, the load applied for the installation trials is to be at least the lesser of 30 per cent of the maximum design load or 80 per cent of vessel bollard pull.

1.1.3 At the Owner's request and in order to enhance safety and awareness on board during ship operation, the **ShipRight SEA(ICE) Ship Event Analysis Procedure** may be applied. This procedure may be applied to all ships where it is intended to provide a hull surveillance system for monitoring of the ship's hull girder stresses and local ice loads when the ship is navigating in ice, and warning the ship's personnel that the load levels or the frequency and magnitude of ice impacts are approaching a level where corrective action is advisable. See Pt 1, Ch 2, 2.8 Descriptive notes 2.8.3 and Pt 3, Ch 16, 6 Ship Event Analysis.

1.1.4 At the Owner's request and in order to enhance safety, the **ShipRight FDA ICE Fatigue Induced by Ice Loading Procedure** may be applied. This procedure is supplementary to the FDA procedures and is to assess fatigue damage induced by ice loads for ships navigating in ice-covered regions. The objective of the **ShipRight FDA ICE** procedure is to provide technical guidelines to assess fatigue at the end connections of stiffeners in the ice belt regions under ice loading. See Pt 1, Ch 2, 2.3 Class notations (hull) 2.3.17 and Pt 3, Ch 16, 4 Fatigue design assessment.

Section 2 Ice environment

2.1 General

2.1.1 This Section is intended to give assistance on the selection of a suitable ice class notation for the operation of ships in ice-covered regions.

2.1.2 The Owner is to confirm which notation is most suitable for their requirements. Ultimately, the responsibility rests with the master of the ship and their assessment of the ice and temperature conditions at the time.

2.1.3 The documentation supplied to the ship is to contain the ice class notation adopted, any operation limits for the ship and guidance on the type of ice that can be navigated for the nominated ice class.

2.2 Definitions

2.2.1 The World Meteorological Organisation's, WMO, definitions for sea ice thickness are given in *Table 1.2.1 WMO definition of ice conditions*.

Table 1.2.1 WMO definition of ice conditions

Ice conditions		Ice thickness range
Old ice	Multi-year	>2,5 m
	Second-year	<2,5 m
First-year ice	Thick first-year	>1,2 m
	Medium first-year	0,7 - 1,2 m
	Thin first-year, second stage	0,5 - 0,7 m
	Thin first-year, first stage	0,3 - 0,5 m
	Grey-white	0,15 - 0,3 m
	Grey	0,1 - 0,15 m
Nilas		<0,1 m

2.2.2 *Table 1.2.2 Comparison of ice Standards* defines the ice classes in relation to the Rules and the equivalent Internationally Recognised Standards.

Table 1.2.2 Comparison of ice Standards

Lloyd's Register class notation	Finnish-Swedish Ice Class	Canadian type
Ice Class 1AS FS(+) Ice Class IAS FS	IA Super	A
Ice Class 1A FS(+) Ice Class 1A FS	IA	B
Ice Class 1B FS(+) Ice Class 1B FS	IB	C
Ice Class 1C FS(+) Ice Class 1C FS	IC	D
Ice Class 1D	—	E
Ice Class 1E	—	E

2.3 Application

2.3.1 The variable nature of ice conditions is such that the average limits of the conditions are not easily defined. However, it is possible to plot the probable limits of the ice flows and the ice edge for each season. See *Figure 1.2.1 Ice Limits for the Arctic Winter* to *Figure 1.2.4 Ice Limits for the Antarctic Summer*, and *Table 1.2.3 Concentration of ice*.

2.3.2 Operation with **Ice Class 1C FS** may be possible up to 150 nm inside the 7/10 region shown depending on the severity of the winter. Operation with **Ice Class 1A FS** may be possible up to 150 nm inside the medium first-year ice shown depending on the severity of the winter. Operation up to the multi-year ice is possible most years with **Ice Class 1AS FS**.

2.3.3 Operation in the region between 7/10 and 1/10 in the ice-covered regions is possible with due care for ships with no ice class. For ships operating for extended periods in these areas, it will be necessary to specify and design for a minimum

temperature for the hull materials. To cover all situations for a non-ice class ship, the material requirements of the *Rules for the Winterisation of Ships, July 2021* are recommended.

Table 1.2.3 Concentration of ice

Free ice		0/10				
Open water		<1/10				
Very open drift		1/10		2/10		3/10
Open drift		4/10		5/10		6/10
Close pack/drift		7/10		8/10		
Very close pack		9/10		9+/10		
Compact/consolidated ice		10/10				

2.4 Ice Class notations

2.4.1 Where the requirements of Chapter 2 are complied with, the ship will be eligible for a special features notation as defined in *Pt 1, Ch 2, 2.1 Definitions 2.1.10*, see also *Table 1.1.1 Ice and cold operations*.

2.4.2 In general, an Ice Class Notation contained in this Part of the Rules will only be assigned where the vessel has been assigned a **✱ LMC** notation. A **[✱] LMC** notation may be accepted where ice class machinery items are not included within the scope of the propulsion arrangements for acceptance of a manufacturer's certificate, see *Pt 1, Ch 1 General Regulations*.

2.5 National Authority requirements

2.5.1 Certain areas of operation may require compliance or demonstration of equivalence with National Authority requirements. *Table 1.2.2 Comparison of ice Standards* gives the equivalence of National Authority requirements.

2.5.2 The standards of ice strengthening required by the Rules have been accepted by the Finnish and Swedish Boards of Navigation as being such as to warrant assignment of the Ice Classes given in *Table 1.2.2 Comparison of ice Standards*.

2.5.3 Ships intending to navigate in the Canadian Arctic must comply with the *Canadian Arctic Shipping Safety Pollution Prevention Regulations* under the *Arctic Waters Pollution Prevention Act* and the *Canada Shipping Act, 2001*.

2.5.4 The Canadian Arctic areas have been divided into shipping safety control zones relative to the severity of the ice conditions experienced and, in addition to geographic boundaries, each zone has seasonal limits affecting the necessary Ice Class notation required to permit operations at a particular time of year. It is the responsibility of the Owner to determine which notation is most suitable for their requirements.

2.5.5 Except as otherwise provided by the *Canadian Arctic Shipping Safety Pollution Prevention Regulations*, Canadian vessels in polar waters and foreign vessels in a shipping safety control zone must conform to the requirements of *Chapter XIV - Safety Measures for Ships Operating in Polar Waters* of SOLAS - *International Convention for the Safety of Life at Sea*.

2.5.6 For ships intending to navigate in Finnish-Swedish waters and having a **Polar Ice Class notation**, consideration may need to be given to the installed engine power such that it complies with the applicable *Finnish-Swedish Ice Class Rules*, see *Pt 8, Ch 2, 7 Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS*.

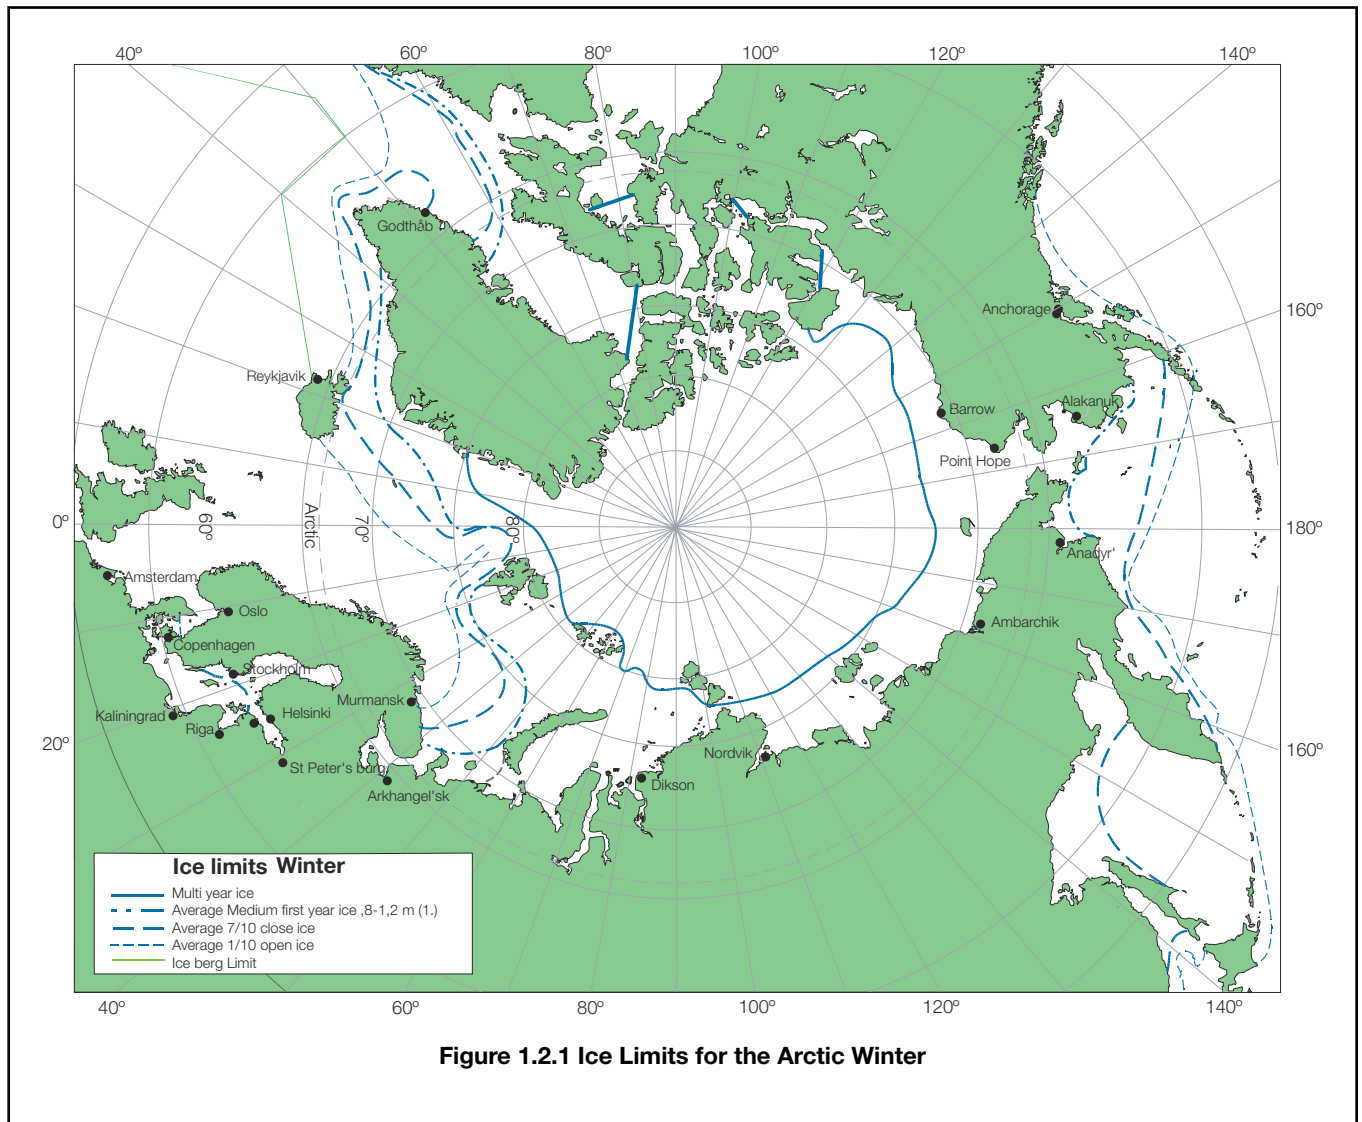

2.6 Ice conditions

2.6.1 Charts and images for the current and recent ice conditions in all areas of the world plus information on icebergs can be found from the National Ice Centre on the world wide web at:

www.natice.noaa.gov

2.6.2 Daily ice information and consultation is available from the Canadian ice service which is part of the Canadian department of the environment. Their web site can be found at:

www.ice-glaces.ec.gc.ca

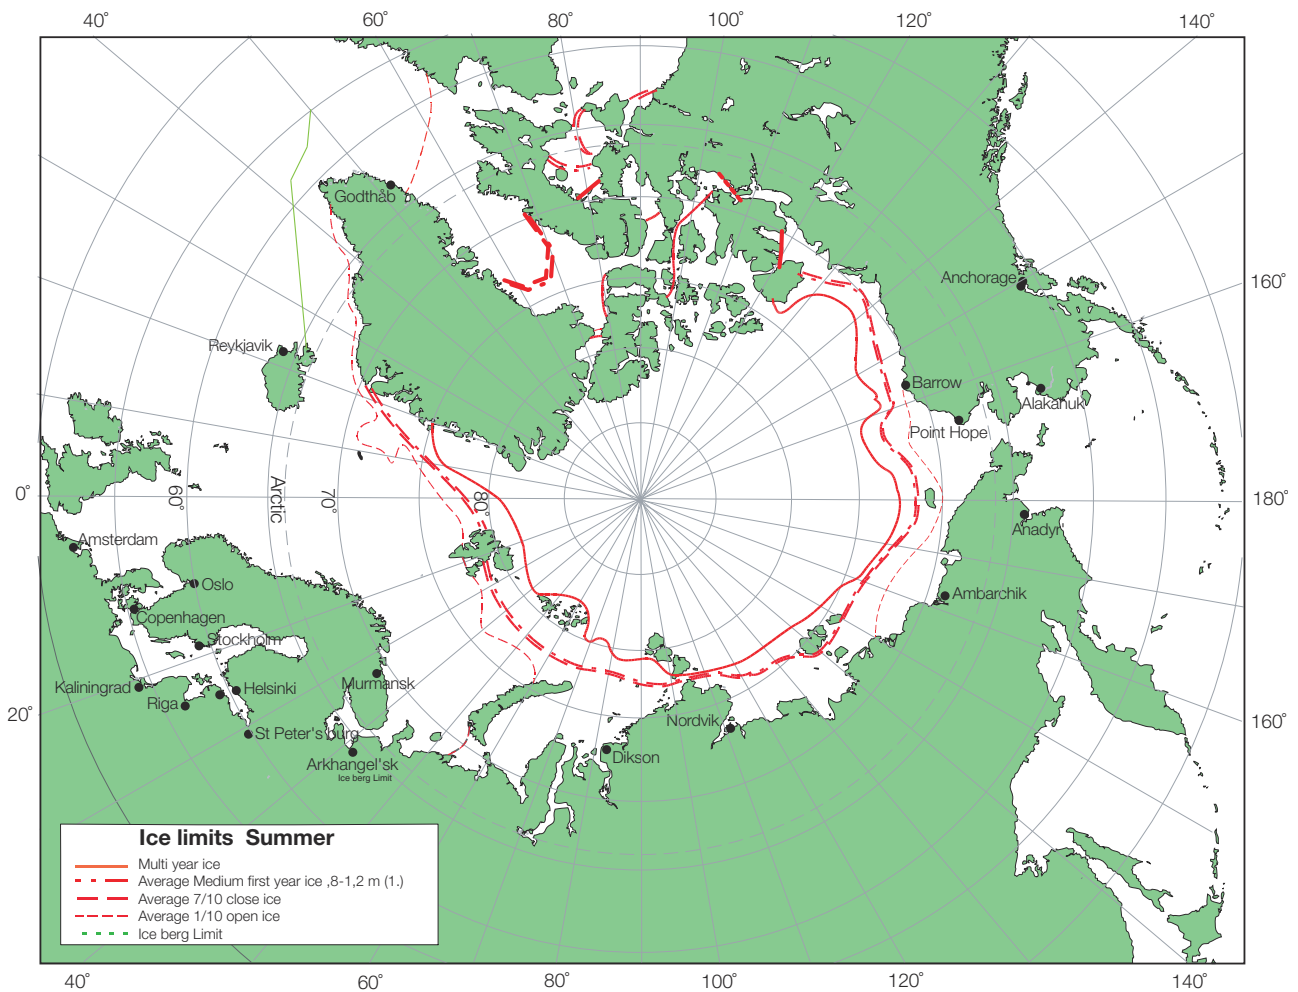

Figure 1.2.2 Ice Limits for the Arctic Summer

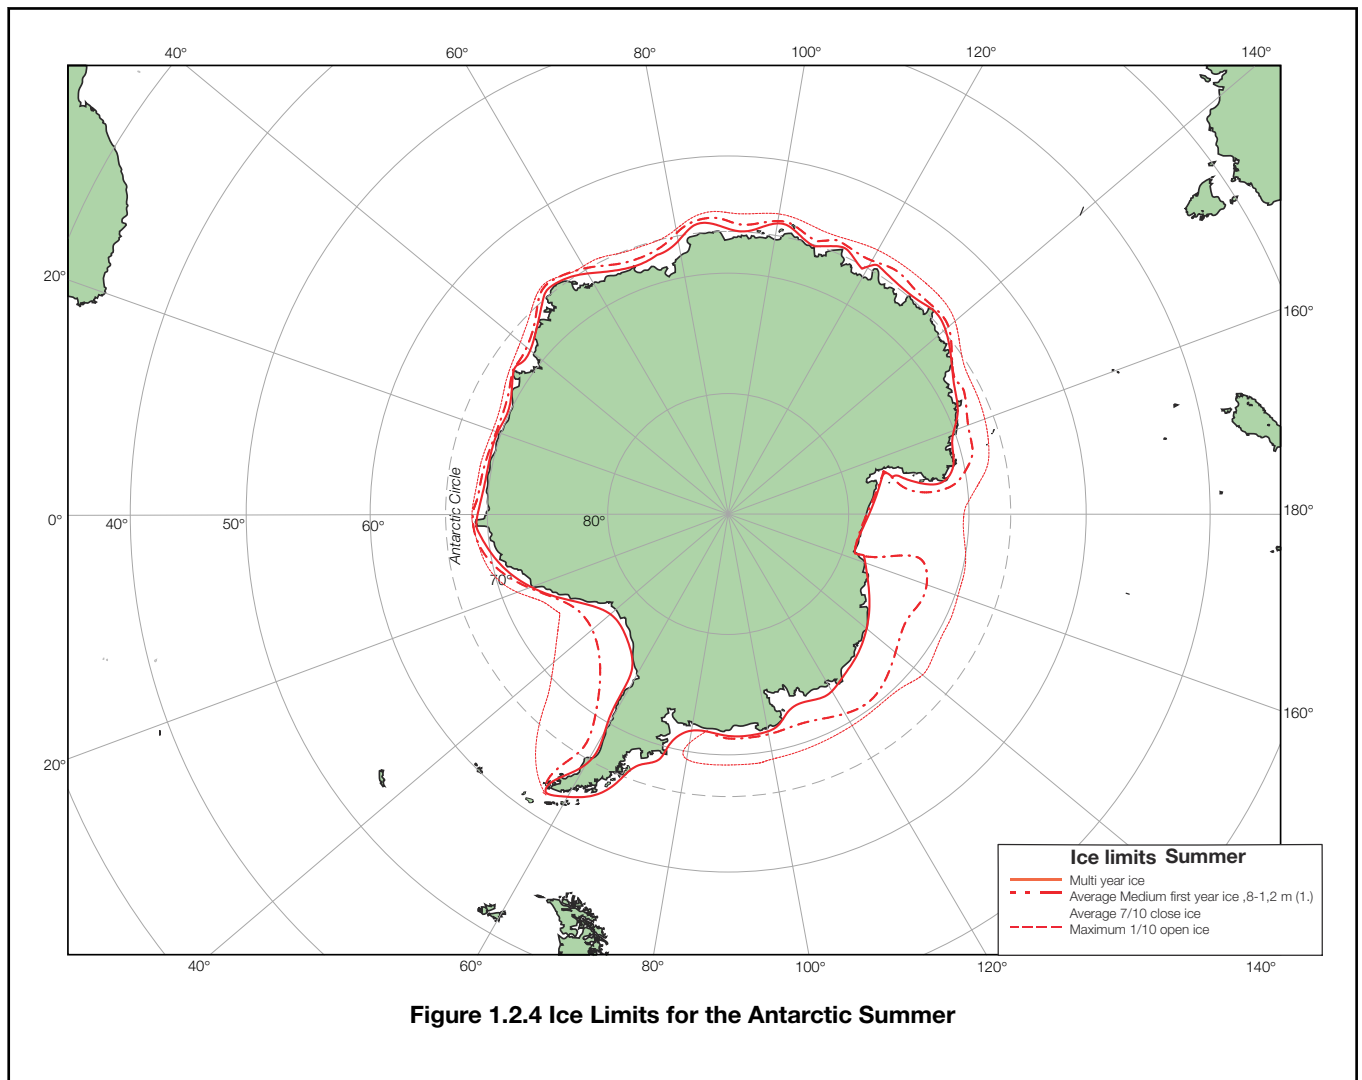

Figure 1.2.3 Ice Limits for the Antarctic Winter

Section 3

Air environment

3.1 Air temperature

3.1.1 For ships intended to operate in cold regions, the temperature on exposed surfaces is to be considered. See the *Rules for the Winterisation of Ships, July 2021*.

3.1.2 The mean daily low temperature is to be taken as the lowest mean daily low air temperature in the area of operation. For seasonally restricted service the lowest value within the period of operation applies:

where

Mean = statistical mean over a minimum of 10 years

Average = average during one day and one night

Lowest = lowest during the year or season

MDHT = Mean Daily High Temperature

MDAT = Mean Daily Average Temperature

MDLT = Mean Daily Low Temperature

Figure 1.3.1 Air temperature shows the definition graphically.

Figure 1.3.1 Air temperature

3.1.3 The external design air temperature is to be taken as the lowest mean daily low air temperature in the area of operation for the season of operation (T_y) minus 10 degrees Celsius ($t = T_y - 10$). For example: $T_y = -20^\circ\text{C}$, $t = -30^\circ\text{C}$.

3.1.4 Lowest mean daily low air temperatures for the Arctic and Antarctic are provided in *Figure 1.3.2 Lowest mean daily air temperatures for the Arctic* and *Figure 1.3.3 Lowest mean daily air temperatures for the Antarctic*.

Figure 1.3.2 Lowest mean daily air temperatures for the Arctic

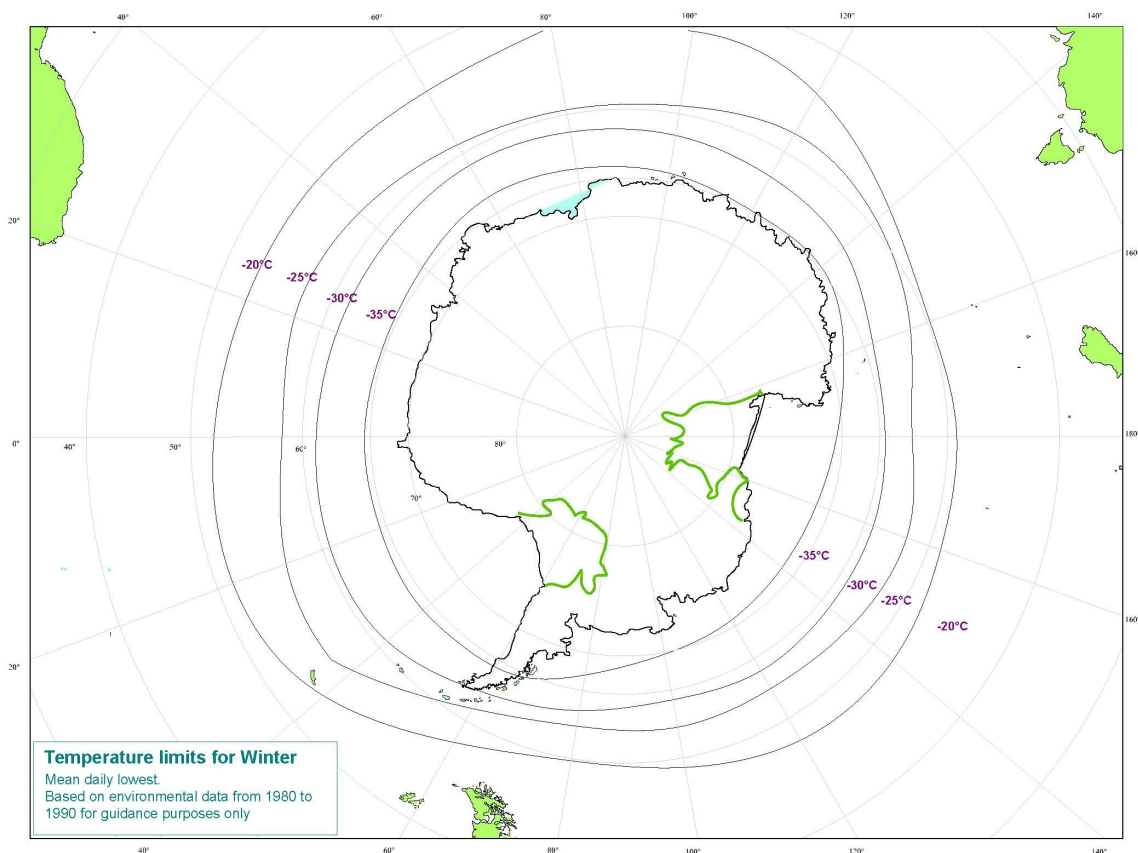

Figure 1.3.3 Lowest mean daily air temperatures for the Antarctic

Section 4

Icing environment

4.1 Ice accretion

4.1.1 For ships intended to operate in cold regions, the build up of ice on exposed surfaces is to be considered. See the *Rules for the Winterisation of Ships, July 2021*.

4.1.2 Icing is to be considered for vessels operating in the following areas, see *Figure 1.4.1 Ice accretion limits for the Arctic* and *Figure 1.4.2 Ice accretion limits for the Antarctic*.

- The area north of latitude 65°30'N, between longitude 28°W and the West coast of Iceland; north of the north coast of Iceland; north of the rhumb line running from latitude 66°N, longitude 15°W to latitude 73°30'N, longitude 15°E, north of latitude 73°30'N between longitude 15°E and 35°E, and east of longitude 35°E, as well as north of latitude 56°N in the Baltic Sea.
- The area north of latitude 43°N bounded in the west by the North American coast and the east by the rhumb line running from latitude 43°N, longitude 48°W to latitude 63°N, longitude 28°W and thence along longitude 28°W.
- All sea areas north of the North American continent west of the areas defined in subparagraphs above.
- The Bering and Okhotsk Seas and the Tartary Strait during the icing season.
- South of latitude 60°S.

- 12 **Requirements for Icebreaker(+)**

■ Section 1 Strengthening requirements for navigation in ice – Application of requirements

1.1 Additional strengthening

1.1.1 Where additional strengthening is fitted in accordance with the requirements given in this Chapter, an appropriate special features notation will be assigned. It is the responsibility of the Owner to determine which notation is most suitable for his requirements.

1.1.2 Where a special features notation is desired, the ship is to comply with the requirements of the applicable Sections, in addition to those for sea-going service, so far as they are applicable.

1.1.3 Where the hull and machinery are constructed so as to comply with the requirements of different ice classes, then the assigned Ice Class Notation will be indicated for the combination as the lower of these classes on the Certificate of Class. Any compliance of the hull or machinery with the requirements of a higher ice class will be indicated in square brackets after the main notation. Other supplementary information that would influence the ice performance will also be indicated. For example, a ship hull built in compliance with 1B FS and the machinery in compliance with **1AS FS** would be assigned the Notation **Ice Class 1B FS [1AS FS Machinery]** or **Ice Class 1B FS [1AS FS azimuth thrusters]** where azimuth thrusters are included in the approval.

1.1.4 The vertical extent of the ice strengthening is related to the upper ice waterline and lower ice waterline, which are defined in *Pt 8, Ch 2, 2.2 Definitions*. The maximum and minimum draughts at the fore, amidships and aft ends (for the lowest ice class) are to be stated on the Certificate of Class.

1.1.5 For ships that comply with the requirements of the *Finnish-Swedish Ice Class Rules*, the installed and required minimum engine output (for the lowest ice class), see *Pt 8, Ch 2, 7 Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS*, will be stated on the Certificate of Class.

1.2 Application for light ice conditions

1.2.1 The requirements for **Ice Class IE** are for ships with length less than 150 m and are intended to navigate in very light first-year ice conditions, such as in brash ice and small ice pieces. The requirements of *Pt 8, Ch 2, 4 Hull requirements for light ice conditions – Ice Classes 1D and 1E* and *Pt 8, Ch 2, 5 Machinery requirements for light ice conditions – Ice Classes 1D and 1E* are to be complied with.

1.2.2 The requirements for **Ice Class 1D** are for ships intended to navigate in light first-year ice conditions. The requirements for strengthening the forward region, the rudder and steering arrangements for **Ice Class 1C FS** are applicable.

1.3 Application for first-year ice conditions

1.3.1 Ships that comply with the requirements of the Finnish Swedish Ice Class Rules and *Pt 8, Ch 2, 6 Hull requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D* and *Pt 8, Ch 2, 7 Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS*, for **Ice Class IA Super, IA, IB** and **IC** may be assigned the corresponding notations **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** or **Ice Class 1C FS**. The *Finnish-Swedish Ice Class Rules* may be obtained from the following website:

www.trafi.fi

1.3.2 For ships where the ice class notation **Ice Class 1AS FS(+)**, **Ice Class 1A FS(+)**, **Ice Class 1B FS(+)** or **Ice Class 1C FS(+)** is requested, the requirements of the *Finnish-Swedish Ice Class Rules*, and Sections 8 and 9 are to be complied with.

1.4 Application for multi-year ice conditions

1.4.1 The requirements for strengthening for navigation in ice, as given in *Pt 8, Ch 2, 10 Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and *Pt 8, Ch 2, 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker*, are intended for ships operating in multi-year ice in Arctic or Antarctic ice conditions under their own power and constructed of steel.

1.4.2 For ships assigned a Polar Class (**PC**) notation, the hull form and propulsion power are to be such that the ship can operate independently and at a continuous speed in a representative ice condition, as defined in *Table 2.1.1 Polar class descriptions* for the corresponding Polar Class. For ships and ship-shaped units which are intentionally not designed to operate independently in ice, such operational intent or limitations will be explicitly stated on the Certificate of Class.

1.4.3 For ships of polar classes **PC1**, **PC2**, **PC3**, **PC4** and **PC5**, bows are to be of icebreaking form with bow angles generally within the range specified in *Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.5*. Other bow forms are to be specially considered, see *Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.9*. Bows with vertical sides and bulbous bows are generally to be avoided.

1.4.4 For ships of polar classes **PC6** and **PC7** that are designed with a bow with vertical sides or with a bulbous bow, operational limitations (restricted from intentional ramming) in the design conditions are to be stated on the Certificate of Class.

1.4.5 Ships that comply with *Pt 8, Ch 2, 10 Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and *Pt 8, Ch 2, 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* can be considered for a Polar Class (**PC**) notation as listed in *Table 2.1.1 Polar class descriptions*.

1.4.6 The Polar Class (**PC**) notations and descriptions are given in *Table 2.1.1 Polar class descriptions*. It is the responsibility of the Owner to select an appropriate Polar Class. The descriptions in *Table 2.1.1 Polar class descriptions* are intended to guide owners, designers and administrations in selecting an appropriate Polar Class to match the requirements for the ship with its intended voyage or service.

1.4.7 The Polar Class notation is used throughout *Pt 8, Ch 2, 10 Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and *Pt 8, Ch 2, 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* to convey the differences between classes with respect to operational capability and strength.

Table 2.1.1 Polar class descriptions

Polar Class	Ice description (based on WMO Sea Ice Nomenclature)
Ice Class PC 1	Year-round operation in all Polar waters
Ice Class PC 2	Year-round operation in moderate multi-year ice conditions
Ice Class PC 3	Year-round operation in second-year ice which may include multi-year ice inclusions

Ice Operations - Ice Class

Part 8, Chapter 2

Section 2

Ice Class PC 4	Year-round operation in thick first-year ice which may include old ice inclusions
Ice Class PC 5	Year-round operation in medium first-year ice which may include old ice inclusions
Ice Class PC 6	Summer/autumn operation in medium first-year ice which may include old ice inclusions
Ice Class PC 7	Summer/autumn operation in thin first-year ice which may include old ice inclusions

1.5 Icebreakers

1.5.1 Sea-going ships specially designed for ice-breaking duties will be assigned the ship type notation **'Icebreaker'** in addition to the special features notation appropriate to the degree of ice strengthening provided. 'Icebreaker' refers to any ship having an operational profile that includes escort or ice management functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, and having a class certificate endorsed with this notation. The additional ship type notations may be assigned as follows:

Icebreaker Refers to a ship having an operational profile that includes escort, research or support functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, see *Pt 8, Ch 2, 10.9 Hull area factors 10.9.4*.

Icebreaker(+) Refers to a ship for which the powering and scantlings of the hull structure and propulsion machinery necessary to undertake the operational profile as determined in the ship specific scenario document have been assessed, see *Pt 8, Ch 2, 12 Requirements for Icebreaker(+)*.

1.6 Loading manual

1.6.1 Sufficient information is to be supplied to the Master of every ship to enable him to arrange loading and ballasting in such a way as to avoid the creation of unacceptable stresses in the ship's structure. The following information is to be included in the vessel's loading manual:

- (a) Upper and lower ice waterline.
- (b) Propeller immersion.
- (c) Indication of whether the vessel is strengthened for icebreaker towing.

Section 2

General hull requirements for navigation in ice – All ice classes

2.1 General

2.1.1 The following Sections are to be complied with for all Ice Classes, where applicable. Alternative arrangements to attain similar performance will be specially considered.

2.1.2 The ballast capacity of the ship is to be sufficient to give adequate propeller immersion in all ice navigating conditions without trimming the ship in such a manner that the actual waterline at the bow is below the lower ice waterline.

2.1.3 Fresh water and sea-water ballast tanks, the tops of which are situated above the design ballast waterline and adjacent to the shell, which are intended to be used in ice and cold navigating conditions, are to be provided with means to prevent freezing. Measures are to be provided to demonstrate that they protect against the following:

- (a) hull structural damage from pumping water creating a vacuum beneath a layer of ice across the top of the water in the tank, and
- (b) hull structural damage from ice expansion, and
- (c) engineering systems, such as piping systems and components, damage from ice expansion or ice blockage, and
- (d) engineering systems, such as piping systems and components, damage from ice pieces melting or dislodging from upper sections of the tank.

Heating coils are considered an effective means for tanks entirely above the waterline. Heating coils or other effective means such as continuous circulation, air bubbling and/or tank pressure/engineering systems alarms are considered effective for tanks partially

below the waterline. Alternatively, demonstration that the above hazards have been mitigated is to be submitted through theoretical calculations, service experience, experimental tests, or a combination thereof.

2.1.4 These Rules are formulated for both transverse and longitudinal framing systems but it is recommended that, whenever practicable, transverse framing is selected.

2.1.5 These Rules assume that when approaching ice infested waters, the ship's speed will be reduced appropriately. The vertical extent of ice strengthening for ships intended to operate at speeds exceeding 15 knots in areas containing isolated ice floes will be specially considered.

2.1.6 An icebreaking ship is to have a hull form at the fore end adapted to break ice effectively. It is recommended that bulbous bows are not fitted to **Ice Class 1AS** ships.

2.1.7 The stern of an icebreaking ship is to have a form such that broken ice is effectively displaced.

2.1.8 Where it is desired to make provision for short tow operations, the bow area is to be suitably reinforced. Similarly, icebreakers may require local reinforcement in way of the stern fork.

2.1.9 Shell strakes in way of ice strengthening area for plates are to be grade B/AH.

2.1.10 To prevent unintended contact and permit close tow operations, provision of a bow ice knife (plate fitted between stern and bulbous bow) is not recommended for ships intended to navigate with icebreaker escort.

2.2 Definitions

2.2.1 The upper and lower ice waterlines upon which the design of the vessel has been based is to be indicated in the classification certificate. The upper ice waterline (UIWL) is to be defined by the maximum draughts fore, amidships and aft. The lower ice waterline (LIWL) is to be defined by the minimum draughts fore, amidships and aft.

2.2.2 The lower ice waterline is to be determined with due regard to the vessel's ice-going capability in the ballast loading conditions (e.g. propeller submergence).

2.2.3 The upper ice waterline (UIWL) and lower ice waterline (LIWL) are to be indicated on the plans. For navigation in certain geographical areas, the relevant National Authority may require the maximum Ice Class draught to be marked on the ship in a specified manner.

2.2.4 **Displacement Δ** is the displacement at the upper ice waterline (UIWL) when floating in water having a relative density of 1.0. For first-year ice class Rules, the displacement is in tonnes. For multi-year ice class Rules, the displacement is in kilo tonnes.

2.2.5 **Shaft power, P_0** , is the maximum propulsion shaft power, in kW, for which the machinery is to be classed.

2.3 Rudder and steering arrangements

2.3.1 Rudder stoppers working on the rudder blade or rudder head are to be fitted to ships assigned the notations **Ice Class 1AS FS, 1AS FS(+), 1A FS, 1A FS(+)** and to ships assigned Polar Class **(PC)** notations.

2.3.2 The design ice force on the rudder, based on the maximum rudder torque, shall be transmitted to the rudder stoppers without damage to the steering system.

2.3.3 The design ice force on the rudder stopper shall be considered as $F_s = M_x/d_s$, where M_x is the maximum design rudder torque determined according to the requirements of the *Finnish-Swedish Ice Class Rules* for ships assigned the notations **Ice Class 1AS FS, 1A FS** and *Pt 8, Ch 2, 10.25 Rudders* for ships assigned Polar Class **(PC)** notations, and d_s is the distance between the centre of the rudder stock and the rudder stopper. The allowable stresses given in *Table 2.2.1 Allowable stress in rudder stopper, ice knife and supporting structure in way of rudder stopper, ice knife* are not to be exceeded in the stoppers, their supporting structure, and the throat of the stopper welds.

2.3.4 Rudder stoppers are to be arranged such that protection of the steering gear is provided two degrees before the maximum travel of the steering gear.

2.3.5 The steering gear, rudder stock and upper edge of the rudder are to be protected from loads from ice impact when operating astern. A robust ice knife or equivalent means of protecting the rudder head and upper edge of the rudder is to be fitted to ships assigned the notations **Ice Class 1AS FS, 1A FS**, and to ships assigned Polar Class **(PC)** notations.

2.3.6 The width of the ice knife shall provide protection to the rudder two degrees either side of the centreline. The lower edge of the ice knife should extend below the upper edge of the rudder's trailing edge or lower ice waterline, whichever is the lowest. For a ship with large draught variations, the ice knife shall extend below the upper edge of the rudder's trailing edge.

Ice Operations - Ice Class

Part 8, Chapter 2

Section 3

2.3.7 The design force for the ice knife, F_k , shall be determined as $F_k = p h l$, where p is the ice pressure and h is the ice load height calculated according to the stern hull area according to the requirements of the *Finnish-Swedish Ice Class Rules* for ships assigned the notations **Ice Class 1AS FS, 1A FS** or *Pt 8, Ch 2, 10.7 Design load patch* and *Pt 8, Ch 2, 10.8 Pressure within the design load patch* for ships assigned Polar Class (**PC**) notations respectively. The load length, l , is to be considered according to the ice knife construction, but in general is to be taken as the support frame transverse spacing.

2.3.8 For the Ice Classes **1AS FS, 1A FS** and Polar Class (**PC**) notations, due regard is to be paid to the excessive load caused by the rudder being forced out of the midship position when backing into an ice ridge. When vessels are intended to operate with significant time in astern operation, then the hull strength is to be based on the method used in the forward region; however, due consideration may be given to the anticipated power in this mode of operation.

2.3.9 For plated structures, the thickness of the boundaries of the ice knife structure is not to be less than that of the rudder side plating.

Table 2.2.1 Allowable stress in rudder stopper, ice knife and supporting structure in way of rudder stopper, ice knife

	Von Mises stress, in N/mm ²	Shear stress, in N/mm ²
Allowable Stress	235/ k	138/ k , see Note 1
Where $k = 235 / s_0$ s_0 = specified minimum yield stress of the material, in N/mm ² Note 1. When the direct calculation is based on beam theory, the allowable shear stress must be not be greater than 122/ k .		

Section 3

General machinery requirements for navigation in ice – All Ice Classes

3.1 Materials for shafting

3.1.1 The following Sections are to be complied with for all Ice Classes, where applicable. Alternative arrangements to attain similar performance will be considered.

3.1.2 All components of the main propulsion system are to be of steel or other approved ductile material.

3.2 Materials for propellers

3.2.1 Propellers and propeller blades are to be of cast steel or copper alloys and are to be manufactured, tested and certified in accordance with *Ch 4, 1 General requirements*, *Ch 4, 5 Castings for propellers* and *Ch 9, 1 Castings for propellers* of the Rules for Materials respectively.

3.2.2 For steel propellers, the elongation of the material used is to be not less than 15 per cent for a test piece length of $5d$. Charpy impact tests are to be carried out in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021*.

3.2.3 Cast steel load transmitting components of controllable pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of *Ch 4, 5 Castings for propellers* of the Rules for Materials.

3.2.4 Forged steel load transmitting components of controllable pitch propellers are to be manufactured, tested, and certified in accordance with *Ch 5, 1 General requirements* and *Ch 5, 2 Forgings for ship and other structural applications* of the Rules for Materials. Impact tests are to be carried out at minus 10°C and the average energy value is to be not less than 20 J.

3.2.5 Spheroidal cast iron load transmitting-components of controllable-pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of *Table 7.3.5 Mechanical properties: special qualities* in *Ch 7, 3 Spheroidal or nodular graphite iron castings* of the Rules for Materials.

3.3 Ship-side valves

3.3.1 The sea inlet and overboard discharge valves which are situated at or below the maximum Load Line, are to be provided with low pressure steam or compressed air connection for clearing purposes, see *Pt 5, Ch 13 Ship Piping Systems*. Provisions need not be applied for the discharge from the main engine and central cooling water system for first-year and multi-year ice classes.

3.3.2 When steam is not available for clearing, it is recommended that arrangements be made for supplying water for machinery cooling purposes by circulating from ballast tanks(s) of adequate capacity, preferably situated in the double bottom. Such tank(s) must be used only for storage of water ballast or fresh water.

3.4 Fire pumps in motor ships

3.4.1 In motor ships where clearing steam is not available, fire pumps are to be provided with suctions from a suitable sea water inlet which is maintained ice-free at all times.

3.4.2 At least one of the fire pumps is to be connected to a sea chest which is provided with de-icing arrangements.

3.5 Main propulsion and essential auxiliary engines

3.5.1 Sea inlets for the cooling water system are to be provided with arrangements to maintain ice free cooling water arrangements as given by IMO *MSC/Circular.504 – Guidance on Design and Construction of Sea Inlets Under Slush Ice Conditions – (28 April 1989)* or by the *Finnish Swedish Ice Class Rules*. Alternative arrangements will be considered, such as by circulating engine cooling water via designated tanks where heat balance calculations have demonstrated that the engines are capable of operating at their maximum continuous rating.

3.5.2 For electric propulsion systems, the total engine output for propulsion provided by generator sets/central generation system is to be based on the calculation with one set out of action, see *Pt 6, Ch 2, 16 Electric propulsion*.

Section 4

Hull requirements for light ice conditions – Ice Classes 1D and 1E

4.1 Ice Class 1D

4.1.1 The requirements for strengthening the forward region for **Ice Class 1C FS** are applicable. See *Pt 8, Ch 2, 6 Hull requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D*.

4.2 Ice Class 1E – General

4.2.1 These requirements apply to ships with length less than 150 m and which are intended to operate in very light first-year ice conditions. Where additional strengthening is fitted in accordance with the requirements of this sub-Section, the notation **Ice Class 1E** will be assigned.

4.2.2 The requirements for shell plating need only be applied in the shaded region shown in *Figure 2.4.1 Extent of application of plating requirements*. The requirements for framing need only be applied forward of the flat of side.

4.2.3 For longitudinally framed ships, the scantlings of shell plating and framing are to comply with the requirements of **Ice Class 1C FS** using 0,9 times the ice pressure.

4.2.4 For transversely framed ships, the requirements of *Pt 8, Ch 2, 4.3 Shell plating* are to be applied.

4.2.5 Where the structural requirements of **Ice Class 1C FS** give lesser scantlings than the requirements of this sub-Section, the lesser scantlings may be applied.

4.3 Shell plating

4.3.1 The shell plating thickness within the region shown in *Figure 2.4.1 Extent of application of plating requirements* is not to be less than:

$$t = 21,75s \sqrt{k \left(\frac{BL^2}{110000} + 1 \right) \left(1,3 - \frac{4,2}{(0,26/s + 1,8)^2} \right)} + 2 \text{ mm}$$

where

s = spacing of main frames, in metres

L and B = are defined in Pt 3, Ch 1, 6.1 Principal particulars

k = is defined in Pt 3, Ch 2, 1.2 Steel.

Upper Ice Waterline and Lower Ice Waterline are defined in Pt 8, Ch 2, 2.2 Definitions L, as defined in Pt 3, Ch 1, 6.1 Principal particulars

Figure 2.4.1 Extent of application of plating requirements

4.4 Transverse framing

4.4.1 The section modulus of main frames forward of the flat of side is not to be less than:

$$Z = 6,08s/lk \left(\frac{BL^2}{140000} + 1,23 \right) \left(7 - \frac{1}{2l} \right) \text{ cm}^3$$

but need not be taken as greater than:

$$Z = s L T$$

where

s = spacing of main frames, in metres

l = span, in metres

L and B = are defined in Pt 3, Ch 1, 6.1 Principal particulars

k = is defined in Pt 3, Ch 2, 1.2 Steel.

4.4.2 Intermediate ice frames are to be fitted in the region forward of the flat of side and are to extend from 0,62 m above the upper ice waterline to 1 m below the lower ice waterline.

4.4.3 Intermediate ice frames aft of the collision bulkhead are to have a section modulus not less than 65 per cent of that given in Pt 8, Ch 2, 4.4 Transverse framing 4.4.1.

4.4.4 Intermediate ice frames forward of the collision bulkhead are to have a section modulus not less than 40 per cent of that given in Pt 8, Ch 2, 4.4 Transverse framing 4.4.1.

4.5 Primary longitudinal members supporting ice frames

4.5.1 Forward of the collision bulkhead, in single deck ships, an ice stringer is to be fitted approximately 0,25 m below the upper ice waterline and is to have scantlings in accordance with Table 5.4.4 Primary structure forward in Pt 3, Ch 5 Fore End Structure.

4.5.2 Aft of the collision bulkhead a series of tripping brackets are to be fitted at each main and intermediate frame at the same level as the ice stringer to a distance 0,1L aft of the flat of side.

4.6 Stern frame and rudder – Ice Class 1D

4.6.1 The rudder and stern frame scantlings are to be in accordance with *Pt 8, Ch 2, 6.7 Rudder and steering arrangements*.

4.7 Weld connections

4.7.1 Weld connections to the shell plating forward of the collision bulkhead are to be double continuous.

■ Section 5

Machinery requirements for light ice conditions – Ice Classes 1D and 1E

5.1 General

5.1.1 Where the notation **Ice Class 1D** or **Ice Class 1E** is desired, the requirements of this Section, in addition to those for open water service, are to be complied with.

5.1.2 The requirements need not be taken as greater than those for **Ice Class 1C FS**.

5.2 Engine power

5.2.1 The total engine output is to be not less than determined by the following formula:

$$P = 0,72LB \text{ kW}$$

where

L = Rule length, in metres, see *Pt 3, Ch 1, 6.1 Principal particulars 6.1.1*

B = moulded breadth of ship, in metres, see *Pt 3, Ch 1, 6.1 Principal particulars 6.1.3*.

5.3 Main engine shafting and propellers

5.3.1 The diameters of the shafting and propeller blade thickness as required by the Rules for open water service are to be increased by the percentages as given in *Table 2.5.1 Increase for main engine shafting and propellers*. No increase in the diameter of crankshafts, thrustshafts or intermediate shafts is required.

5.3.2 The screwshaft may be tapered at the forward end in accordance with *Pt 5, Ch 6, 3.5 Screwshafts and tube shafts 3.5.3* and *Pt 5, Ch 6, 3.5 Screwshafts and tube shafts 3.5.4* subject to the increase in diameter of 5 per cent as required by *Pt 8, Ch 2, 5.3 Main engine shafting and propellers 5.3.1*.

Table 2.5.1 Increase for main engine shafting and propellers

Screwshaft, increase in diameter as required by <i>Pt 5, Ch 6, 3.5 Screwshafts and tube shafts</i>	5%
Propeller, increase in blade thickness at root and at 60 per cent radius as required by <i>Pt 5, Ch 7, 3.1 Minimum blade thickness</i>	8%
Keyless propeller fitting, increase in mean torque as defined in <i>Pt 5, Ch 7, 3.2 Keyless propellers</i>	15%

5.4 Minimum propeller blade tip thickness

5.4.1 The tip thickness, t , of the blade at 95 per cent radius is to be not less than that obtained by the following formula:

$$t = 0,14(T + 57) \sqrt[3]{\frac{430}{\sigma_u}}$$

mm.

where

T = blade root thickness required by Pt 8, Ch 2, 5.3 Main engine shafting and propellers 5.3.1, in mm

σ_u = specified minimum tensile strength of material, in N/mm²

5.5 Blade edge thickness

5.5.1 The edges of the blades are to be suitably thickened for the operating conditions but are to be not less than 50 per cent of the required tip thickness, t , measured at 1,25 times tip thickness, t , from the edge. For controllable pitch propellers, this requirement need only be applied to the leading edges of the blades.

5.6 Cooling water lines

5.6.1 Connections are to be fitted between the cooling water overboard discharge lines and sea inlets for main and/or auxiliary engine cooling water systems so that warm water may be used to assist in maintaining the suction pipes free from ice.

5.6.2 Where the cooling water inlet valves are fitted to a common water box, the connections from the cooling water discharge lines may be led to the water box in a position as near as possible to the inlet valves.

Section 6

Hull requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D

6.1 General

6.1.1 In addition to the requirements of the *Finnish-Swedish Ice Class Rules*, the following Sections are to be complied with for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS**, **Ice Class 1C FS** and **Ice Class 1D**, where applicable. Alternative arrangements to attain similar performance will be considered.

6.2 Framing – General requirements

6.2.1 Where a frame intersects a boundary between two of the hull regions the scantling requirements applicable will be those for the forward region if the forward midship boundary is intersected or for the midship region if the aft midship boundary is intersected.

6.2.2 The effective weld area attaching ice frames to primary members is not to be less than the shear area for the frames.

6.2.3 Asymmetrical frames and frames which are not at right angles to the shell (web less than 90 degrees to the shell) shall be supported against tripping by brackets, intercostals, stringers or similar, at a distance not exceeding 1300 mm. For **Ice Class 1D**, the distance may be increased to 2000 mm. For frames with spans greater than 4 m the extent of anti-tripping supports is to be applied to all regions. For frames with spans less than or equal to 4 m the extent is to be as given in *Table 2.6.1 Extent of anti-tripping supports*. FEA may be carried out to demonstrate equivalent support of alternative arrangements.

Table 2.6.1 Extent of anti-tripping supports

Ice Class	Extent of anti-tripping supports
1AS FS	All regions
1A FS	Forward and midship regions

Ice Operations - Ice Class

Part 8, Chapter 2

Section 6

1B FS	Forward region
1C FS	Forward region
1D	Forward region

6.3 Primary longitudinal members supporting transverse ice framing

6.3.1 The webs of primary longitudinal members supporting transverse ice frames are to be stiffened and connected to the main or intermediate frames so that the distance, r , between such stiffening is not to be greater than given according to the following formula:

$$r = \sqrt{\frac{291t^3}{\alpha_o \gamma^2}} \text{ mm}$$

where

t = thickness, in mm, of the primary longitudinal member adjacent to the shell plating

α_o = longitudinal distribution factor as given in *Table 2.6.2 Longitudinal distribution factor α_o*

γ = (a) Forward region

$$\gamma = 0,653 + 3,217 \sqrt{P_0 \Delta} \times 10^{-5}$$

$$= 0,876 + 9,908 \sqrt{P_0 \Delta} \times 10^{-6}$$

or

$\gamma = 1,0$, whichever is the least

(b) Midship and aft regions

$$\gamma = 0,653 + 9,908 \sqrt{P_0 \Delta} \times 10^{-6}$$

or

$\gamma = 1,0$, whichever is the least

P_0 and Δ = are as defined in *Pt 8, Ch 2, 2.2 Definitions*.

6.3.2 The minimum thickness of the web plating of longitudinal primary members is to comply with the requirements of *Pt 3, Ch 10, 4 Construction details for primary members*.

Table 2.6.2 Longitudinal distribution factor α_o

Ice Class	α_o		
	Forward	Midship	Aft
1AS FS	1,00	0,98	0,89
1A FS	0,87	0,75	0,64
1B FS	0,78	0,64	0,51
1C FS	0,68	0,53	0,37
1D	0,68	—	—

6.4 Stem

6.4.1 The stem is to be made of rolled, cast or forged steel or of shaped steel plates. A sharp edged stem, as shown in *Figure 2.6.1 A sharp edged stem*, improves the manoeuvrability of the ship in ice. Where a sharp angle stem is fitted, the section modulus as given in *Pt 8, Ch 2, 6.4 Stem 6.4.2* and *Pt 8, Ch 2, 6.4 Stem 6.4.3* is to apply to the stem section only, otherwise the section modulus may be applied including side plates.

Figure 2.6.1 A sharp edged stem

6.4.2 The section modulus of the stem in the fore and aft direction is not to be less than determined in accordance with the following formula:

$$Z = 1500 (\alpha_o \gamma^2)^{3/2} \text{ cm}^3$$

where

α_o = longitudinal distribution factor for the forward region as given in *Table 2.6.2 Longitudinal distribution factor α_o*

γ = is defined in *Pt 8, Ch 2, 6.3 Primary longitudinal members supporting transverse ice framing 6.3.1*.

6.4.3 The dimensions of a welded stem constructed as shown in *Figure 2.6.1 A sharp edged stem* are to be determined in accordance with the following formula:

$$t = 31 \sqrt{\alpha_o \gamma^2} \text{ mm}$$

where

t = thickness of the side plates, in mm.

6.4.4 In bulbous bow constructions, the extent of plating below the Ice Light Waterline should be such as to cover that part of the bulb forward of the vertical line originating at the intersection of the Ice Light Waterline and the stem contour at the centreline. A suitably tapered transition piece should be arranged between the reinforced stem plating and keel. However, in no case should the reinforced stem plating extend vertically below the Ice Light Waterline for less than 750 mm. The adjacent strake to the reinforced shaped stem plating of the bulb should be in accordance with the requirements for shell plating.

6.4.5 Where in the ice belt region the radius of the stem or bulb front plating is large, one or more vertical stiffeners are to be fitted in order to meet the section modulus requirement of *Pt 8, Ch 2, 6.4 Stem 6.4.2*. In addition, vertical ring stiffening will be required for the bulb.

6.4.6 The dimensions of the stem may be tapered to the requirements of *Pt 3, Ch 5, 3.3 Stem* at the upper deck. The connections of the shell plating to the stem are to be flush.

6.5 Stern

6.5.1 Where the screwshaft diameter exceeds the Rule diameter, the propeller post is to be correspondingly strengthened, see *Pt 3, Ch 6, 7 Sternframes and appendages*.

6.6 Renewal criteria within ice strengthening area for CSR ships

6.6.1 For double hull oil tankers and bulk carriers that are compliant with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*, the renewal criteria of the local structure for general corrosion is to be calculated in accordance with the applicable CSR renewal criteria.

6.7 Rudder and steering arrangements

6.7.1 Rudder scantlings, posts, rudder horns, solepieces, rudder stocks, steering engine and pintles are to be dimensioned in accordance with *Pt 3, Ch 6 Aft End Structure* and *Pt 3, Ch 13 Ship Control Systems* as appropriate. The speed used in the calculations is to be the maximum service speed or that given in *Table 2.6.3 Minimum speed*, whichever is the greater. When used in association with the speed given in *Table 2.6.3 Minimum speed*, the rudder profile coefficients are to be taken as 1,1.

Table 2.6.3 Minimum speed

Ice Class	Minimum speed, in knots
1AS FS	20
1A FS	18
1B FS	16
1C FS	14
1D	14

6.7.2 For double plate rudders, the minimum thickness of plating and horizontal and vertical webs is to be determined as for shell plating in the midbody region. For the horizontal and vertical webs, the corrosion-abrasion increment, need not be added. For **Ice Class 1D**, the minimum thickness of plating and webs, of double plate rudders and the extent of application are to be determined as for those in **Ice Class 1C FS**.

6.7.3 Where an ice class notation is included in the class of a ship, the nozzle construction requirements, as defined in *Table 13.3.1 Nozzle construction* in *Pt 3, Ch 13 Ship Control Systems*, are to be upgraded to include abrasion allowance as follows:

Ice Class	Thickness increment
1AS FS	5 mm
1A FS	4 mm
1B FS	3 mm
1C FS	2 mm
1D	2 mm

However, the thickness of the shroud plating is not to be less than the shell plating for the aft region taking frame spacing s in the formula as 500 mm.

6.7.4 The scantlings of the stock, pintles, gudgeon and solepiece associated with the nozzle are to be increased on the basis given in *Pt 8, Ch 2, 6.7 Rudder and steering arrangements 6.7.1*. However, the diameter of the nozzle stock is to be not less than that calculated in the astern condition taking the astern speed as half the speed given in *Table 2.6.3 Minimum speed* or the actual astern speed, whichever is the greater.

6.7.5 Nozzles with articulated flaps will be subject to special consideration.

6.7.6 For the Ice Classes **1AS FS** and **1A FS**, the rudder stock and the upper edge of the rudder shall be protected against ice pressure by an ice knife or equivalent means. The ice knife is to extend down to the ice light waterline; this requirement may be waived where this would lead to impracticable ice knives, e.g. for ships with large draught variations.

6.7.7 For the Ice Classes **1AS FS** and **1A FS**, due regard is to be paid to the excessive load caused by the rudder being forced out of the midship position when backing into an ice ridge. When vessels are intended to operate with significant time in

astern operation, then the hull strength is to be based on the method used in the forward region; however, due consideration may be given to the anticipated power in this mode of operation.

6.7.8 Relief valves for hydraulic pressure are to be effective, see *Pt 5, Ch 19, 3.3 Valve and relief valve arrangements*. The components of the rudder steering gear are to be able to withstand the yield torque of the rudder stock, see *Pt 5, Ch 19, 3.2 Components 3.2.2*.

■ Section 7

Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS

7.1 General

7.1.1 In addition to the requirements of the *Finnish-Swedish Ice Class Rules*, the following Sections are to be complied with for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** and **Ice Class 1C FS**, where applicable. Alternative arrangements to attain similar performance will be specially considered.

7.2 Determination of ice torque

7.2.1 If the propeller is not fully submerged when the ship is in ballast condition, the requirements for **Ice Class 1A FS** is to be used for **Ice Class 1B FS** and **Ice Class 1C FS**.

7.3 Propeller blade sections

7.3.1 Where the blade thickness derived from the *Finnish-Swedish Ice Class Rules* is less than the blade thickness derived by *Pt 5, Ch 7, 3.1 Minimum blade thickness*, the latter is to apply.

7.4 Intermediate blade sections

7.4.1 The thickness of other sections is to conform to a smooth curve connecting the section thicknesses as determined by the *Finnish-Swedish Ice Class Rules*.

7.5 Blade edge thickness

7.5.1 The thickness of blade edges is to be not less than 50 per cent of the derived tip thickness, t , measured at $1,25t$ from edge. For controllable pitch propellers, this applies only to the leading edge.

7.6 Mechanisms for controllable pitch propellers

7.6.1 The strength of mechanisms in the boss of a controllable pitch propeller is to be 1,5 times that of the blade when a load is applied at the radius $0,9D/2$ in the weakest direction of the blade.

7.7 Keyless propellers

7.7.1 When it is proposed to use keyless propellers, the fit of the propeller boss to the screwshaft will be specially considered.

7.8 Screwshafts

7.8.1 Where the screwshaft diameter as derived by the *Finnish-Swedish Ice Class Rules* is less than the diameter derived by *Pt 5, Ch 6, 3.5 Screwshafts and tube shafts 3.5.1*, the latter is to apply.

7.8.2 The diameter, d_s , of the screwshaft determined in accordance with the *Finnish-Swedish Ice Class Rules* is to extend over a length not less than that to the forward edge of the bearing immediately forward of the propeller or $2,5d_s$ whichever is the greater.

7.8.3 The shaft may be tapered at the forward end in accordance with *Pt 5, Ch 6, 3.5 Screwshafts and tube shafts 3.5.3* and *Pt 5, Ch 6, 3.5 Screwshafts and tube shafts 3.5.4*, except for **Ice Class 1AS FS** ice strengthening, where these diameters are to be increased by 10 per cent.

7.8.4 For screwshafts in ships intended for the notation **Ice Class 1AS FS** or **Ice Class 1A FS** and where the connection between the propeller and the screwshaft is by means of a key, Charpy impact tests are to be made in accordance with the requirements of *Ch 5, 3.4 Mechanical tests 3.4.12* of the Rules for Materials.

7.9 Intermediate and thrust shafts

7.9.1 The diameters of intermediate shafts and thrust shafts in external bearings are to comply with *Pt 5, Ch 6, 3.1 Intermediate shafts* and *Pt 5, Ch 6, 3.4 Thrust shafts* respectively, except for **Ice Class 1AS FS** ice strengthening where these diameters are to be increased by 10 per cent.

■ **Section 8**

Hull requirements for first-year ice conditions – Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)

8.1 General

8.1.1 The requirements for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** and **Ice Class 1C FS**, as applicable, are to be applied using the installed engine power as given by *Pt 8, Ch 2, 9 Machinery requirements for first-year ice conditions - Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)*.

■ **Section 9**

Machinery requirements for first-year ice conditions - Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)

9.1 Powering of ice strengthened ships

9.1.1 For ships that require additional strengthening in ice, the total shaft power installed is to be calculated using the following Sections, but is not to be less than required by the *Finnish-Swedish Ice Class Rules* in force at the time of contract.

9.1.2 Ice strengthened ships which are to be considered to have an icebreaking capability are to be able to develop sufficient thrust to permit continuous mode icebreaking at a speed of at least five knots in ice having a thickness equal to the nominal value for the desired Ice Class and a snow cover of at least 0,3 m.

9.1.3 The shaft power necessary to provide an icebreaking capability can be determined by the equation:

$$P_1 = 0,736C_1C_2C_3C_4[240Bh(1+h+0,035v^2)+70S_c\sqrt{L}] \text{ kW}$$

where

B = moulded breadth of ship, in metres, see *Pt 3, Ch 1, 6.1 Principal particulars 6.1.3*

L = Rule length, in metres, see *Pt 3, Ch 1, 6.1 Principal particulars 6.1.1*

Δ = displacement, in tonnes, see *Pt 3, Ch 9, 7.2.1*

$$C_1 = \frac{1,2B}{\sqrt[3]{\Delta}} \text{ but is not to be taken as less than } 1,0$$

C_2 = 0,9 if the ship is fitted with a controllable pitch propeller, otherwise 1,0

C_3 = 0,9 if the rake of the stem is 45° or less, otherwise 1,0. The product $C_2 C_3$ is not to be taken as less than 0,85

$C_4 = 1,1$ if the ship is fitted with a bulbous bow, otherwise 1,0

h = ice thickness

= 1,0 for **Ice Class 1AS FS(+)**

= 0,8 for **Ice Class 1A FS(+)**

= 0,6 for **Ice Class 1B FS(+)**

= 0,4 for **Ice Class 1C FS(+)**

S_c = depth of snow cover

v = ship speed, in knots, when breaking ice of thickness h .

9.2 Materials for shafting

9.2.1 For screwshafts in ships intended for the notation **Ice Class 1AS FS(+)** or **Ice Class 1A FS(+)** and where the connection between the propeller and the screwshaft is by means of a key, Charpy impact tests are to be made in accordance with the requirements of *Ch 5, 3.4 Mechanical tests 3.4.12* of the Rules for Materials.

■ Section 10

Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker

10.1 Definitions

10.1.1 The length L_{UI} is the distance, in m, measured horizontally from the fore side of the stem at the intersection with the upper ice waterline (UIWL) to the after side of the rudder post, or the centre of the rudder stock if there is no rudder post. L_{UI} is not to be less than 96 per cent, and need not be greater than 97 per cent, of the extreme length of the upper ice waterline (UIWL) measured horizontally from the fore side of the stem. In ships with unusual stern and bow arrangement the length L_{UI} will be specially considered.

10.1.2 The ship displacement Δ_{UI} is the displacement, in kilo tonnes, of the ship corresponding to the upper ice waterline (UIWL). Where multiple waterlines are used for determining the UIWL, the displacement is to be determined from the waterline corresponding to the greatest displacement.

10.2 Hull areas

10.2.1 The hull of all polar class ships is divided into areas reflecting the magnitude of the loads that are expected to act upon them, see *Figure 2.10.1 Extent of hull areas*. In the longitudinal direction, there are four regions:

- (a) bow, (B);
- (b) bow intermediate, (B_i);
- (c) midbody, (M), and
- (d) stern (S).

The bow intermediate, midbody and stern regions are further divided in the vertical direction into three regions:

- (a) bottom, (b)
- (b) lower, (l) and
- (c) icebelt (i).

10.2.2 The upper ice waterline, UIWL, and lower ice waterline, LIWL, are as defined in *Pt 8, Ch 2, 2.2 Definitions*.

10.2.3 In addition to *Figure 2.10.1 Extent of hull areas*, at no time is the boundary between the bow and bow intermediate regions to be forward of the intersection point of the line of the stem and the ship baseline.

10.2.4 In addition to *Figure 2.10.1 Extent of hull areas*, the aft boundary of the bow region need not be more than $0,45L_{UI}$ aft of the fore side of the stern at the intersection with the upper ice waterline (UIWL)

10.2.5 The forward boundary of the stern region is to be at least a distance Z from the aft end of L_{UI} , where Z is $0,7b$ or $0,15L_{UI}$ whichever is greater. b is the distance from the aft end of L_{UI} to the maximum half breadth at the UIWL and L_{UI} is defined in *Pt 8, Ch 2, 10.1 Definitions*.

10.2.6 The boundary between the bottom and lower regions is to be taken at the point where the tangent to the shell is inclined 7° from horizontal.

10.2.7 If a ship is intended to operate astern in ice regions, the aft section of the ship is to be designed based on the bow and bow intermediate hull area requirements. See the *Rules for the Classification of Stern First Ice Class Ships, July 2021*.

10.2.8 In addition to *Figure 2.10.1 Extent of hull areas* if the ship is assigned the additional notation **Icebreaker** the forward boundary of the stern region is to be at least $0,04L$ forward of the section where the parallel ship side at the upper ice waterline (UIWL) ends.

10.3 Design ice loads – General

10.3.1 For ships of all Polar Classes, a glancing impact on the bow is the design scenario for determining the scantlings required to resist ice loads.

10.3.2 The design ice load is characterised by an average pressure, P_a , uniformly distributed over a rectangular load patch of height, b , and width, w .

10.3.3 Within the bow area of all polar classes, and within the bow intermediate icebelt area of polar classes **PC6** and **PC7**, the ice load parameters are functions of the actual bow shape. To determine the ice load parameters, P_a , b and w , it is required to calculate the following ice load characteristics for sub-regions of the bow area; shape coefficient, f_{ai} , total glancing impact force, F_i , line load, Q_i , and pressure, P_i .

10.3.4 For polar classes **PC6** and **PC7** the ice load parameters, P_a , b and w , determined as a function of the bow shape in bow region, B , are also to be applied to bow intermediate icebelt region, Bli .

Ice Operations - Ice Class

Part 8, Chapter 2

Section 10

10.3.5 In other ice-strengthened areas, the ice load parameters, P_a , b_{NB} and w_{NB} , are determined independently of the hull shape and based on a fixed load patch aspect ratio, $AR = 3.6$.

10.3.6 Design ice forces calculated according to *Pt 8, Ch 2, 10.5 Bow area 10.5.3* are applicable for icebreaking bow forms where the buttock angle γ at the stem is positive and less than 80° , and the normal frame angle β' at the centre of the foremost sub-region, as defined in *Figure 2.10.2 Definition of hull angles*, is greater than 10° .

10.3.7 Design ice forces calculated according to *Pt 8, Ch 2, 10.5 Bow area 10.5.4* are applicable for ships of polar classes **PC6** and **PC7** and have a bow form with vertical sides. This includes bows where the normal frame angle β' at the considered sub-regions, as defined in *Figure 2.10.2 Definition of hull angles* are between 0 and 10° .

10.3.8 For ships of polar classes **PC6** and **PC7** with bulbous bows the design ice forces on the bow are to be determined according to *Pt 8, Ch 2, 10.5 Bow area 10.5.4*. In addition, the design forces are not to be taken less than those given in *Pt 8, Ch 2, 10.5 Bow area 10.5.3*, assuming $f_a = 0,6$ and $AR = 1,3$.

10.3.9 For ships with bow forms other than those defined in *Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.6* to *Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.8*, design ice forces for any other bow forms are to be specially considered.

10.3.10 Ship structures that are not directly subjected to ice loads may still experience inertial loads of stowed cargo and equipment resulting from ship/ice interaction. These inertial loads are to be considered in the design of these structures.

10.4 Glancing impact load characteristics

10.4.1 The parameters defining the glancing impact load characteristics are reflected in the class factors listed in *Table 2.10.1 Class factors for icebreaking bow forms* and *Table 2.10.2 Class factors for vertical side bow forms*.

Table 2.10.1 Class factors for icebreaking bow forms

Polar Class	Crushing failure class factor	Flexural failure class factor	Load patch dimensions class factor	Displacement class factor	Longitudinal strength class factor
	C_C	C_F	C_D	C_{DI}	C_L
PC1	17,69	68,60	2,01	250	7,46
PC2	9,89	46,80	1,75	210	5,46
PC3	6,06	21,17	1,53	180	4,17
PC4	4,50	13,48	1,42	130	3,15
PC5	3,10	9,00	1,31	70	2,50
PC6	2,40	5,49	1,17	40	2,37
PC7	1,80	4,06	1,11	22	1,81

Table 2.10.2 Class factors for vertical side bow forms

Polar Class	Crushing failure class factor	Line load class factor	Pressure class factor
	C_{CV}	C_{QV}	C_{PV}
PC6	3,43	2,82	0,65
PC7	2,60	2,33	0,65

10.5 Bow area

10.5.1 In the bow area, the force, F , line load, Q , pressure, P , and load patch aspect ratio, AR , associated with the glancing impact load scenario are functions of the hull angles measured at the upper ice waterline, UIWL. The influence of the hull angles is captured through calculation of a bow shape coefficient, f_a . The hull angles are defined in *Figure 2.10.2 Definition of hull angles*.

10.5.2 The waterline length of the bow region, C , is generally to be divided along the UIWL into four sub-regions of equal length. The force, F , line load, Q , pressure, P , and load patch aspect ratio, AR , are to be calculated with respect to the mid-length position of each sub-region (each maximum of F , Q and P is to be used in the calculation of the ice load parameters P_a , b and w).

10.5.3 The bow area load characteristics for icebreaking bow forms, as defined in Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.6, are determined as follows:

(a) The shape coefficient, fa_i , is to be taken as:

$$fa_i = fa_{i,1}$$

$$fa_{i,2}$$

$fa_{i,3}$ whichever is the lesser

where

$$fa_{i,1} = \left(0,097 - 0,68 \left(\frac{x}{L_{UI}} - 0,15 \right)^2 \right) \frac{\alpha_i}{\sqrt{\beta'_i}}$$

$$fa_{i,2} = \frac{1,2C_F}{\sin(\beta'_i)C_c\Delta_{UI}^{0,64}}$$

$$fa_{i,3} = 0,60$$

i = sub-region considered

L_{UI} = length, as defined in *Pt 8, Ch 2, 10.1 Definitions*.

x = distance from the fore side of the stem at the intersection with the upper ice waterline (UIWL) station under consideration, in metres

α_i = waterline angle, in degrees, see *Figure 2.10.2 Definition of hull angles*

β'_i = normal frame angle, in degrees, see *Figure 2.10.2 Definition of hull angles*

Δ_{UI} = displacement, in kilo tonnes, not to be taken less than 5 as defined in *Pt 8, Ch 2, 10.1 Definitions 10.1.2*, in kilo tonnes, not to be taken less than 5

C_C = crushing failure class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

C_F = flexural failure class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

(b) Force, F_i :

$$F_i = fa_i C_C \Delta_{UI}^{0,64} \text{ MN}$$

where

i = sub-region considered

fa_i = shape coefficient of sub-region, i

C_C = crushing failure class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

Δ_{UI} = displacement as defined in *Pt 8, Ch 2, 10.1 Definitions 10.1.2*, in kilo tonnes, not to be taken less than 5

(c) Load patch aspect ratio, AR_i :

$$AR_i = 7,46 \sin(\beta'_i)$$

$$AR_i \geq 1,3$$

where

i = sub-region considered

β'_i = normal frame angle of sub-region i , in degrees

(d) Line load, Q_i :

$$Q_i = \frac{F_i^{0,61} C_D}{AR_i^{0,35}} \text{ MN/m}$$

where

i = sub-region considered

F_i = force of sub-region i , in MN

C_D = load patch dimensions class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

AR_i = load patch aspect ratio of sub-region i

(e) Pressure, P_i :

$$P_i = F_i^{0,22} C_D^2 AR_i^{0,3} \text{ MPa}$$

where

i = sub-region considered

F_i = force of sub-region i , in MN

C_D = load patch dimensions class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

AR_i = load patch aspect ratio of sub-region i .

10.5.4 The bow area load characteristics for bow forms with vertical sides, as defined in *Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.7*, are determined as follows:

(a) The shape coefficient, fa_i , is to be taken as:

$$fa_i = \frac{a_i}{30}$$

where

i = sub-region considered

α = waterline angle, in degrees, see *Figure 2.10.2 Definition of hull angles*

(b) Force, F_i :

$$F_i = fa_i C_{CV} \Delta_{UI}^{0,47} \text{ MN}$$

where

i = sub-region considered

fa_i = shape coefficient of sub-region, i

C_{CV} = crushing failure class factor from *Table 2.10.2 Class factors for vertical side bow forms*

Δ_{UI} = displacement as defined in *Pt 8, Ch 2, 10.1 Definitions 10.1.2*, in kilo tonnes, not to be taken less than 5

(c) Line load, Q_i :

$$Q_i = F_i^{0,22} C_{QV} \text{ MN/m}$$

where

i = sub-region considered

F_i = force of sub-region i , in MN

C_{QV} = line load class factor from *Table 2.10.2 Class factors for vertical side bow forms*

(d) Pressure, P_i :

$$P_i = F_i^{0,56} C_{PV} \text{ MPa}$$

where

i = sub-region considered

F_i = force of sub-region i , in MN

C_{PV} = pressure class factor from *Table 2.10.2 Class factors for vertical side bow forms*

10.6 Hull areas other than the bow

10.6.1 In the hull areas other than the bow, the force, F_{NB} , and line load, Q_{NB} , used in the determination of the load patch dimensions, b_{NB} , w_{NB} , and design pressure, P_a , are determined as follows:

(a) Force, F_{NB} :

$$F_{NB} = 0,36 C_C \Delta_F \text{ MN}$$

where

C_C = crushing force class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

Δ_F = ship displacement factor

$$= \Delta_{UI}^{0,64} \text{ if } \Delta_{UI} \leq C_{DI}$$

$$= C_{DI}^{0,64} + 0,10 (\Delta_{UI} - C_{DI}) \text{ if } \Delta_{UI} > C_{DI}$$

Δ_{UI} = displacement as defined in *Pt 8, Ch 2, 10.1 Definitions 10.1.2*, in kilo tonnes, not to be taken less than 10

C_{DI} = displacement class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

(b) Line Load, Q_{NB} :

$$Q_{NB} = 0,639 F_{NB}^{0,61} C_D \text{ MN/m}$$

where

F_{NB} = force from *Pt 8, Ch 2, 10.6 Hull areas other than the bow 10.6.1.(a)*, in MN

C_D = load patch dimensions class factor from *Table 2.10.1 Class factors for icebreaking bow forms*.

10.7 Design load patch

10.7.1 In the bow area, and the bow Intermediate Icebelt area for ships with class notation **PC6** and **PC7**, the design load patch has dimensions of width, w_B , and height, b_B , defined as follows:

$$w_B = \frac{F_B}{Q_B} \text{ m}$$

$$b_B = \frac{Q_B}{P_B} \text{ m}$$

where

F_B = maximum F_i in the bow area, in MN

Q_B = maximum Q_i in the bow area, in MN/m

P_B = maximum P_i in the bow area, in MPa.

10.7.2 In hull areas other than those covered by *Pt 8, Ch 2, 10.7 Design load patch 10.7.1*, the design load patch has dimensions of width, w_{NB} , and height, b_{NB} , defined as follows:

$$w_{NB} = \frac{F_{NB}}{Q_{NB}} \text{ m}$$

$$b_{NB} = \frac{W_{NB}}{3,6} \text{ m}$$

where

F_{NB} = force determined using *Pt 8, Ch 2, 10.6 Hull areas other than the bow 10.6.1.(a)*, in MN

Q_{NB} = line load determined using *Pt 8, Ch 2, 10.6 Hull areas other than the bow 10.6.1.(b)*, in MN/m.

Ice Operations - Ice Class

Part 8, Chapter 2

Section 10

10.8 Pressure within the design load patch

10.8.1 The average pressure, P_a , within a design load patch is determined as follows:

$$P_a = \frac{F}{bw} \text{ MPa}$$

where

$F = F_B$ or F_{NB} as appropriate for the hull area under consideration, in MN

$b = b_B$ or b_{NB} as appropriate for the hull area under consideration, in metres

$w = w_B$ or w_{NB} as appropriate for the hull area under consideration, in metres.

10.8.2 Areas of higher, concentrated pressure exist within the load patch. In general, smaller areas have higher local pressures. Accordingly, the peak pressure factors listed in *Table 2.10.3 Peak pressure factors* are used to account for the pressure concentration on localised structural members.

Table 2.10.3 Peak pressure factors

Structural member		Peak pressure factor, K_i	
Plating	Transversely framed	$K_p = (1,8 - s) \geq 1,2$	
	Longitudinally framed	$K_p = (2,2 - 1,2s) \geq 1,5$	
Frames in transverse framing systems	With load distributing stringers see Note 1	$K_t = (1,6 - s) \geq 1,0$	
	With no load distributing stringers see Note 1	$K_t = (1,8 - s) \geq 1,2$	
Frames in bottom structures		$K_s = 1$	
Load carrying stringers see Note 2		$K_s = 1$	if $S_w \geq 0,5w$
Side longitudinals Web frames		$K_s = 2 - \frac{2S_w}{w}$	if $S_w < 0,5w$
Symbols			
s = frame or longitudinal spacing, in metres			
S_w = web frame spacing, in metres			
w = ice load patch width, in metres			
<p>Note 1. Load distributing stringers are intercostal. Load distributing stringer web height h_{lds} is to be at least 80 per cent of the adjacent main frame web height ($h_{lds} \geq 0,8h$).</p> <p>Note 2. Load carrying stringers are considered as continuous strength members in accordance with <i>Pt 8, Ch 2, 10.14 Framing – Web frame and load carrying stringers</i>. Generally load carrying stringer web height $h_{lcs} \geq 2h$.</p>			

10.9 Hull area factors

10.9.1 Associated with each hull area is an area factor that reflects the relative magnitude of the load expected in that area. The area factor, AF , for each hull area is listed in *Table 2.10.4 Hull area factors (AF)*.

10.9.2 In the event that a structural member spans across the boundary of a hull area, the largest hull area factor is to be used in the scantling determination of the member.

Ice Operations - Ice Class

Part 8, Chapter 2

Section 10

10.9.3 Due to their increased manoeuvrability, ships having propulsion arrangements with azimuth thruster(s) or podded propellers are to have specially considered stern icebelt, S_i , and stern lower, S_l , hull area factors. See the *Rules for the Classification of Stern First Ice Class Ships, July 2021*.

Table 2.10.4 Hull area factors (AF)

Hull area		Area	Polar Class						
			PC1	PC2	PC3	PC4	PC5	PC6	PC7
Bow (B)	All	B	1,00	1,00	1,00	1,00	1,00	1,00	1,00
	Icebelt	BI_i	0,90	0,85	0,85	0,80	0,80	1,00 see Note 1	1,00 see Note 1
Bow intermediate (BI)	Lower	BI_l	0,70	0,65	0,65	0,60	0,55	0,55	0,50
	Bottom	BI_b	0,55	0,50	0,45	0,40	0,35	0,30	0,25
Midbody (M)	Icebelt	M_i	0,70	0,65	0,55	0,55	0,50	0,45	0,45
	Lower	M_l	0,50	0,45	0,40	0,35	0,30	0,25	0,25
	Bottom	M_b	0,30	0,30	0,25	see Note 2	see Note 2	see Note 2	see Note 2
Stern (S)	Icebelt	S_i	0,75	0,70	0,65	0,60	0,50	0,40	0,35
	Lower	S_l	0,45	0,40	0,35	0,30	0,25	0,25	0,25
	Bottom	S_b	0,35	0,30	0,30	0,25	0,15	see Note 2	see Note 2

Note 1. See Pt 8, Ch 2, 10.3 Design ice loads – General 10.3.3.

Note 2. Indicates that strengthening for ice loads is not necessary.

10.9.4 Area factors to be applied to ships assigned the notation **Icebreaker** are given in *Table 2.10.5 Hull area factors (AF) for icebreaker*.

Table 2.10.5 Hull area factors (AF) for icebreaker

	B	BI_i	BI_l	BI_b	M_i	M_l	M_b	S_i	S_l	S_b
PC1	1	0,90	0,70	0,55	0,70	0,50	0,30	0,94	0,56	0,35
PC2	1	0,85	0,65	0,50	0,65	0,45	0,30	0,88	0,50	0,30
PC3	1	0,85	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30
PC4	1	0,85	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30
PC5	1	0,85	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30
PC6	1	1	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30
PC7	1	1	0,65	0,45	0,55	0,40	0,25	0,81	0,44	0,30

10.10 Shell plate requirements

10.10.1 The required minimum shell plate thickness, t , is given by:

$$t = t_{\text{net}} + t_s \text{ mm}$$

where

$$t_{\text{net}} = \text{plate thickness required to resist ice loads according to Pt 8, Ch 2, 10.10 Shell plate requirements 10.10.2, in mm}$$

Ice Operations - Ice Class

Part 8, Chapter 2

Section 10

t_s = corrosion and abrasion allowance according to Pt 8, Ch 2, 10.17 Corrosion/abrasion additions and steel renewal, in mm.

10.10.2 The thickness of shell plating required to resist the design ice load, t_{net} , depends on the orientation of the framing. The plating net thickness is given by Table 2.10.6 Shell plate thickness.

Table 2.10.6 Shell plate thickness

Transversely framed plating see Note 1	Obliquely framed plating	Longitudinally framed plating	
$\Omega \geq 70^\circ$	$70^\circ > \Omega > 20^\circ$	$\Omega \leq 20^\circ$	
		$b \geq s$	$b < s$
$t_{net} = \frac{500s \sqrt{\frac{AF K_p P_a}{\sigma_y}}}{1 + \frac{s}{2b}} \text{ mm}$	linear interpolation	$t_{net} = \frac{500s \sqrt{\frac{AF K_p P_a}{\sigma_y}}}{1 + \frac{s}{2l}} \text{ mm}$	$t_{net} = \frac{500s \sqrt{\frac{AF K_p P_a}{\sigma_y}} \sqrt{\frac{2b}{s} - \left(\frac{b}{s}\right)^2}}{1 + \frac{s}{2l}} \text{ mm}$
Symbols			
<p>where</p> <p>Ω = smallest angle between the chord of the waterline and the line of the first level framing as illustrated in Figure 2.10.3 Shell framing angle Ω, in degrees</p> <p>s = transverse frame spacing in transversely-framed ships or longitudinal frame spacing in longitudinally-framed ships, measured along the girth, in metres</p> <p>AF = hull area factor from Table 2.10.4 Hull area factors (AF) or Table 2.10.5 Hull area factors (AF) for icebreaker, as appropriate</p> <p>K_p = peak pressure factor from Table 2.10.3 Peak pressure factors</p> <p>P_a = average patch pressure according to Pt 8, Ch 2, 10.8 Pressure within the design load patch 10.8.1, in MPa</p> <p>σ_y = minimum upper yield stress of the material, in N/mm²</p> <p>b = height of design load patch, in m, where $b \leq l - \frac{s}{4}$ in the case of determination of the net thickness for transversely framed plating</p> <p>l = distance between frame supports, i.e. equal to the frame span as given in Pt 8, Ch 2, 10.11 Framing – General 10.11.5, but not reduced for any fitted end brackets, in metres. When a load-distributing stringer is fitted, the length, l, need not be taken larger than the distance from the stringer to the most distant frame support.</p>			
<p>Note 1. Includes plating in hull areas B_{lb}, M_b and S_b regardless of actual frame orientation.</p>			

Figure 2.10.3 Shell framing angle Ω

10.11 Framing – General

10.11.1 Framing members of Polar class ships are to be designed to withstand the ice loads defined in *Pt 8, Ch 2, 10.3 Design ice loads – General*

10.11.2 The term ‘framing member’ refers to transverse and longitudinal local frames, load-carrying stringers and web frames in the areas of the hull exposed to ice pressure, see *Figure 2.10.1 Extent of hull areas*. Where load-distributing stringers have been fitted, the arrangement and scantlings of these are to be suitably designed.

10.11.3 The strength of a framing member is dependent upon the fixity that is provided at its supports. Fixity can be assumed where framing members are either continuous through the support or attached to a supporting section with a connection bracket. In other cases, simple support is to be assumed unless the connection can be demonstrated to provide significant rotational restraint. Fixity is to be ensured at the support of any framing which terminates within an ice-strengthened area.

10.11.4 The details of framing member intersection with other framing members, including plated structures, as well as the details for securing the ends of framing members at supporting sections, are to be in accordance with *Pt 3, Ch 10 Welding and Structural Details*.

10.11.5 The effective span of a framing member is to be determined on the basis of its moulded length. If brackets are fitted, the effective span may be reduced in accordance with *Pt 3, Ch 3 Structural Design*.

10.11.6 When calculating the section modulus and shear area of a framing member, the net thicknesses of the web, flange (if fitted) and attached shell plating are to be used. The shear area of a framing member may include that material contained over the full depth of the member, i.e. web area including portion of flange, if fitted, but excluding attached shell plating.

10.11.7 The actual net effective shear area, A_w , of a transverse or longitudinal local frame is given by:

$$A_w = \frac{h t_{wn} \sin \phi_w}{100} \text{ cm}^2$$

where

h = height of stiffener, in mm, see *Figure 2.10.4 Stiffener geometry*

t_{wn} = net web thickness, in mm

$$= t_w - t_c$$

t_w = as built web thickness, in mm, see *Figure 2.10.4 Stiffener geometry*

t_c = corrosion deduction, in mm, to be subtracted from the web and flange thickness (as specified by t_s in *Table 2.10.6 Shell plate thickness*, but not less than t_s as required by *Pt 8, Ch 2, 10.17 Corrosion/abrasion additions and steel renewal 10.17.3*)

φ_w = smallest angle between shell plate and stiffener web, measured at the midspan of the stiffener, see *Figure 2.10.4 Stiffener geometry*. The angle φ_w may be taken as 90° provided the smallest angle is not less than 75° .

10.11.8 When the cross-sectional area of the attached plate flange exceeds the cross-sectional area of the local frame, the actual net effective plastic section modulus, Z_p , of a transverse or longitudinal frame is given by:

$$Z_p = \frac{A_{pn} t_{pn}}{20} + \frac{h_w^2 t_{wn} \sin \varphi_w}{2000} + \frac{A_{fn} (h_{fc} \sin \varphi_w - b_w \cos \varphi_w)}{10} \text{ cm}^3$$

where

A_{pn} = net cross-sectional area of the local frame, in cm^2

t_{pn} = fitted net shell plate thickness, in mm, (complying with t_{net} as required by *Pt 8, Ch 2, 10.10 Shell plate requirements 10.10.2*)

h_w = height of local frame web, in mm, see *Figure 2.10.4 Stiffener geometry*

A_{fn} = net cross-sectional area of local frame flange, in cm^2

h_{fc} = height of local frame measured to centre of the flange area, in mm, see *Figure 2.10.4 Stiffener geometry*

b_w = distance from mid thickness plane of local frame web to the centre of the flange area, in mm, see *Figure 2.10.4 Stiffener geometry*

h , t_w , t_c and φ_w as given in *Pt 8, Ch 2, 10.11 Framing – General 10.11.7*

s as given in *Pt 8, Ch 2, 10.10 Shell plate requirements 10.10.2*

10.11.9 When the cross-sectional area of the local frame exceeds the cross-sectional area of the attached plate flange, the plastic neutral axis is located a distance z_{na} above the attached shell plate, given by:

$$z_{na} = \frac{100A_{fn} + h_w t_{wn} - 1000t_{pn}s}{2t_{wn}} \text{ mm}$$

and the net effective plastic section modulus, Z_p , of a transverse or longitudinal frame is given by:

$$Z_p = t_{pn}s \left(z_{na} + \frac{t_{pn}}{2} \right) \sin \varphi_w + \left(\frac{((h_w - z_{na})^2 + z_{na}^2) t_{wn} \sin \varphi_w}{2000} + \frac{A_{fn} ((h_{fc} - z_{na}) \sin \varphi_w - b_w \cos \varphi_w)}{10} \right) \text{ cm}^3$$

10.11.10 In the case of oblique framing arrangement ($70^\circ > \Omega > 20^\circ$, where Ω is defined as given in *Pt 8, Ch 2, 10.10 Shell plate requirements 10.10.2*), linear interpolation is to be used.

Figure 2.10.4 Stiffener geometry

10.12 Framing – Local frames in bottom structures and transverse local frames in side structures

10.12.1 The local frames in bottom structures (i.e. hull areas B_b , M_b and S_b) and transversely-framed side structures are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism. For bottom structures the load patch shall be applied with the dimension b parallel to the frame direction.

10.12.2 The actual net effective shear area of the frame, A_w , as defined in Pt 8, Ch 2, 10.11 Framing – General 10.11.7, is to comply with the following condition:

$$A_w \geq A_t$$

where

$$A_t = 5000 l_L s \frac{AF K_t P_a}{0,577 \sigma_y} \text{ cm}^2$$

l_L = length of loaded portion of span, in metres

need not exceed the lesser of a and b

a = local frame span as defined in Pt 8, Ch 2, 10.11 Framing – General 10.11.5, in metres

b = height of design ice load patch according to 10.6, in metres

s = spacing of local frame, in metres

AF = hull area factor from Table 2.10.4 Hull area factors (AF) or Table 2.10.5 Hull area factors (AF) for icebreaker, as appropriate

K_t = peak pressure factor from Table 2.10.3 Peak pressure factors, as appropriate

P_a = average pressure within load patch according to Pt 8, Ch 2, 10.8 Pressure within the design load patch, in MPa

σ_y = minimum upper yield stress of the material, in N/mm²

10.12.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p , as defined in Pt 8, Ch 2, 10.11 Framing – General 10.11.8 or Pt 8, Ch 2, 10.11 Framing – General 10.11.9, is to comply with the following conditions and is to be the greatest of the two load conditions:

- (a) ice load acting at the midspan of the local frame, and
 (b) the ice load acting near a support.

$$Z_p \geq Z_{pt}$$

where

$$Z_{pt} = \frac{100^3 l_L Y_{sAFK_t} P_a a A_1}{4 \sigma_y} \text{ cm}^3$$

$$Y = 1 - \frac{l_L}{2a}$$

A_1 = reflects the two conditions and is to be taken as the greater of A_{1A} or A_{1B}

$$A_{1A} = \frac{1}{1 + \frac{j}{2} + k_w \frac{j}{2} (\sqrt{1 - a_1^2} - 1)}$$

$$A_{1B} = \frac{1 - \frac{1}{2a_1 Y}}{0,275 + 1,44 k_z^{0,7}}$$

$j = 1$ for a local frame with one simple support outside the ice strengthened areas

$= 2$ for a local frame without any simple supports

$$a_1 = \frac{A_t}{A_w}$$

A_t = rule minimum shear area of the local frame as given in Pt 8, Ch 2, 10.12 Framing – Local frames in bottom structures and transverse local frames in side structures 10.12.2, in cm^2

A_w = effective net shear area of the local frame (calculated according to Pt 8, Ch 2, 10.11 Framing – General 10.11.7), in cm^2

$$k_w = \frac{1}{1 + \frac{2A_{fn}}{A_w}}$$

A_{fn} = as given in Pt 8, Ch 2, 10.11 Framing – General 10.11.8

$$k_z = \frac{z_p}{Z_p} \text{ in general}$$

$= 0$ when the frame is arranged with end bracket

z_p = sum of individual plastic section moduli of flange and shell plate as fitted, in cm^3

$$= \frac{\frac{b_f t_{fn}^2}{4} + \frac{b_e t_{pn}^2}{4}}{1000}$$

b_f = flange breadth, in mm, see Figure 2.10.4 Stiffener geometry

t_{fn} = net flange thickness, in mm

$$= t_f - t_c$$

t_c = as given in Pt 8, Ch 2, 10.11 Framing – General 10.11.7

t_f = as-built flange thickness, in mm, see Figure 2.10.4 Stiffener geometry

t_{pn} = the fitted net shell plate thickness, in mm, but is not to be less than t_n as given in Pt 8, Ch 2, 10.10 Shell plate requirements

b_e = effective width of shell plate flange, in mm

where

$$= 500s$$

Z_p = net effective plastic section modulus of the local frame (calculated according to *Pt 8, Ch 2, 10.11 Framing – General 10.11.8* or *Pt 8, Ch 2, 10.11 Framing – General 10.11.9*), in cm^3

AF , K_t , P_a , l_L , b , s , a and σ_y are as given in *Pt 8, Ch 2, 10.12 Framing – Local frames in bottom structures and transverse local frames in side structures 10.12.2*.

10.12.4 The scantlings of the local frame are to meet the structural stability requirements of *Pt 8, Ch 2, 10.15 Framing – Structural stability*.

10.13 Framing – Longitudinal local frames in side structures

10.13.1 Longitudinal local frames in side structures are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

10.13.2 The actual net effective shear area of the frame, A_w , as defined in *Pt 8, Ch 2, 10.11 Framing – General 10.11.7*, is to comply with the following condition:

$$A_w \geq A_L$$

where

$$A_L = \frac{5000AFK_sP_ab_1a}{0,577\sigma_y} \text{ cm}^2$$

AF = hull area factor from *Table 2.10.4 Hull area factors (AF)* or *Table 2.10.5 Hull area factors (AF) for icebreaker*, as appropriate

K_s = peak pressure factor from *Table 2.10.3 Peak pressure factors*, as appropriate

P_a = average pressure within load patch according to *Pt 8, Ch 2, 10.8 Pressure within the design load patch 10.8.1*, in MPa

$$b_1 = k_o b_2 \text{ m}$$

$$k_o = 1 - \frac{0,3}{b'}$$

$$b' = \frac{b}{s}$$

b = height of design ice load patch from *Pt 8, Ch 2, 10.7 Design load patch*, in metres

s = spacing of longitudinal frames, in metres

$$b_2 = b(1-0,25b') \text{ m if } b' < 2$$

$$= s \text{ m if } b' \geq 2$$

a = effective span of longitudinal frame as given in *Pt 8, Ch 2, 10.11 Framing – General 10.11.5*, in metres

σ_y = minimum upper yield stress of the material, in N/mm^2

10.13.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p , as defined in *Pt 8, Ch 2, 10.11 Framing – General 10.11.8* or *Pt 8, Ch 2, 10.11 Framing – General 10.11.9*, is to comply with the following condition:

$$Z_p \geq Z_{pL}$$

where

$$Z_{pL} = \frac{100^3 AF K_s P_a b_1 a^2 A_4}{8 \sigma_y} \text{ cm}^3$$

where

$$A_4 = \frac{1}{2 + k_{wl}(\sqrt{1 - a_4^2} - 1)}$$

$$a_4 = \frac{A_L}{A_w}$$

A_L = rule minimum shear area for longitudinal as given in Pt 8, Ch 2, 10.13 Framing – Longitudinal local frames in side structures 10.13.2, in cm²

A_w = net effective shear area of longitudinal (calculated according to Pt 8, Ch 2, 10.11 Framing – General 10.11.7), in cm²

$$k_{wl} = \frac{1}{1 + \frac{2A_{fn}}{A_w}}$$

A_{fn} = as given in Pt 8, Ch 2, 10.11 Framing – General 10.11.8

AF , K_s , P_a , b_1 , a and σ_y are as given in Pt 8, Ch 2, 10.13 Framing – Longitudinal local frames in side structures 10.13.2.

10.13.4 The scantlings of the longitudinals are to meet the structural stability requirements of Pt 8, Ch 2, 10.15 Framing – Structural stability.

10.14 Framing – Web frame and load carrying stringers

10.14.1 Web frames and load-carrying stringers are to be designed to withstand the ice load patch as defined in Pt 8, Ch 2, 10.8 Pressure within the design load patch. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised.

10.14.2 Web frames and load-carrying stringers are to be dimensioned to take into account the combined effects of shear and bending. Where the structural configuration is such that members do not form part of a grillage system, the appropriate peak pressure factor, K_i , from Table 2.10.3 Peak pressure factors is to be used. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

10.14.3 For determination of scantlings on load carrying stringers, web frames supporting local frames, or web frames supporting load carrying stringers forming part of a structural grillage system, appropriate methods as outlined in Pt 8, Ch 2, 10.28 Direct calculations are normally to be used.

10.14.4 The scantlings of web frames and load-carrying stringers are to meet the structural stability requirements of Pt 8, Ch 2, 10.15 Framing – Structural stability.

10.15 Framing – Structural stability

10.15.1 To prevent local buckling in the web, the ratio of web height, h_w , to net web thickness, t_{wn} , of any framing member is not to exceed:

For flat bar sections:
$$\frac{h_w}{t_{wn}} \leq \frac{282}{\sqrt{\sigma_y}}$$

For bulb, tee and angle sections:
$$\frac{h_w}{t_{wn}} \leq \frac{805}{\sqrt{\sigma_y}}$$

where

h_w = web height

t_{wn} = net web thickness

σ_y = minimum upper yield stress of the shell plate in way of the framing member, in N/mm²

10.15.2 Framing members for which it is not practicable to meet the requirements of Pt 8, Ch 2, 10.15 Framing – Structural stability 10.15.1 (e.g. load carrying stringers or deep web frames) are required to have their webs effectively stiffened. The

scantlings of the web stiffeners are to ensure the structural stability of the framing member. The minimum net web thickness for these framing members is given by:

$$t_{wn} = 2,63 \times 10^{-3} c_1 \sqrt{\frac{\sigma_y}{5,34 + 4\left(\frac{c_1}{c_2}\right)^2}} \text{ mm}$$

where

$$c_1 = h_w - 0,8h \text{ mm}$$

h_w = web height of stringer/web frame, in mm, see Figure 2.10.5 Parameter definition for web stiffening

h = height of framing member penetrating the member under consideration (to be taken as zero if no such framing member is fitted), in mm, see Figure 2.10.5 Parameter definition for web stiffening

c_2 = spacing between supporting structure oriented perpendicular to the member under consideration, in mm, see Figure 2.10.5 Parameter definition for web stiffening

σ_y = minimum upper yield stress of the material, in N/mm².

10.15.3 In addition, the following is to be satisfied:

$$t_{wn} \geq 0,35 t_{pn} \sqrt{\frac{\sigma_y}{235}}$$

where

σ_y = minimum upper yield stress of the shell plate in way of the framing member, in N/mm²

t_{wn} = net thickness of the web, in mm

t_{pn} = net thickness of the shell plate in way the framing member, in mm.

10.15.4 To prevent local flange buckling of welded profiles, the following are to be satisfied:

- The flange width, b_f , in mm, is not to be less than five times the net thickness of the web, t_{wn} .
- The flange outstand, b_o , in mm, is to meet the following requirement:

$$\frac{b_o}{t_{fn}} \leq \frac{155}{\sqrt{\sigma_y}}$$

where

t_{fn} = net thickness of flange, in mm

σ_y = minimum upper yield stress of the material, in N/mm².

Figure 2.10.5 Parameter definition for web stiffening

10.16 Plated structures

10.16.1 Plated structures are those stiffened plate elements in contact with the hull and subject to ice loads. These requirements are applicable to an inboard extent which is the lesser of:

- (a) web height of adjacent parallel web frame or stringer; or
 (b) 2,5 times the depth of framing that intersects the plated structure.

10.16.2 The thickness of the plating and the scantlings of attached stiffeners are to be such that the degree of end fixity necessary for the shell framing is ensured.

10.16.3 The stability of the plated structure is to adequately withstand the ice loads defined in *Pt 8, Ch 2, 10.8 Pressure within the design load patch*.

10.17 Corrosion/abrasion additions and steel renewal

10.17.1 Effective protection against corrosion and ice-induced abrasion is recommended for all external surfaces of the shell plating for Polar Class ships.

10.17.2 The values of corrosion/abrasion additions, t_s , to be used in determining the shell plate thickness are listed in *Table 2.10.7 Corrosion/abrasion additions for shell plating*.

10.17.3 Polar Class ships are to have a minimum corrosion/abrasion addition of $t_s = 1,0$ mm applied to all internal structures within the ice strengthened hull areas, including plated members adjacent to the shell, as well as stiffener webs and flanges.

10.17.4 Steel renewal for ice strengthened structures is required when the gauged thickness is less than $t_n + 0,5$ mm.

Table 2.10.7 Corrosion/abrasion additions for shell plating

Hull area	t_s , in mm					
	With effective protection			Without effective protection		
	PC1 to PC3	PC4 and PC5	PC6 and PC7	PC1 to PC3	PC4 and PC5	PC6 and PC7
Bow; Bow Intermediate Icebelt	3,5	2,5	2,0	7,0	5,0	4,0
Bow Intermediate Lower; Midbody & Stern Icebelt	2,5	2,0	2,0	5,0	4,0	3,0
Midbody and Stern Lower; Bottom	2,0	2,0	2,0	4,0	3,0	2,5

10.18 Materials

10.18.1 Steel grades of plating for hull structures are to be not less than those given in *Table 2.10.9 Steel grades for weather exposed plating* to *Table 2.10.11 Steel grades for weather exposed plating* based on the as-built thickness, the Polar Class and the material class of structural members given in *Table 2.10.8 Material classes for structural members of polar ships*.

Ice Operations - Ice Class

Part 8, Chapter 2

Section 10

10.18.2 Material classes specified in *Table 2.2.1 Material classes and grades in Pt 3, Ch 2 Materials*, are applicable to Polar Class ships regardless of the ship's length. In addition, material classes for weather and sea exposed structural members and for members attached to the weather and sea exposed plating are given in *Table 2.10.8 Material classes for structural members of polar ships*. Where the material classes in *Table 2.10.8 Material classes for structural members of polar ships* and those in *Table 2.2.1 Material classes and grades in Pt 3, Ch 2 Materials* differ, the higher material class is to be applied.

10.18.3 Steel grades for all plating and attached framing of hull structures and appendages situated below the level of 0,3 m below the lower waterline, as shown in *Figure 2.10.6 Steel grade requirements for submerged and weather exposed shell plating*, are to be obtained from *Table 2.2.2 Steel grades in Pt 3, Ch 2 Materials*, based on the material class for Structural Members in *Table 2.10.8 Material classes for structural members of polar ships* above, regardless of Polar Class.

10.18.4 Steel grades for all weather exposed plating of hull structures and appendages situated above the level of 0,3 m below the lower ice waterline, as shown in *Figure 2.10.6 Steel grade requirements for submerged and weather exposed shell plating*, are to be not less than given in *Table 2.10.9 Steel grades for weather exposed plating* to *Table 2.10.11 Steel grades for weather exposed plating*.

10.18.5 Castings are to have specified properties consistent with the expected service temperature for the cast component.

Table 2.10.8 Material classes for structural members of polar ships

Structural members	Material Class
Shell plating within the bow and bow intermediate icebelt hull areas (B , B_{II})	II
Plating materials for stem and stern frames, rudder horn, rudder, propeller nozzle, shaft brackets, ice skeg, ice knife and other appendages subject to ice impact loads	II
All weather and sea exposed SPECIAL, as defined in <i>Table 2.2.1 Material classes and grades in Pt 3, Ch 2 Materials</i> , structural members within 0,2L from FP	II
All weather and sea exposed SECONDARY and PRIMARY, as defined in <i>Table 2.2.1 Material classes and grades in Pt 3, Ch 2 Materials</i> , structural members outside 0,4L amidships	I
All inboard framing members attached to the weather and sea-exposed plating including any contiguous inboard member within 600 mm of the plating	I
Weather-exposed plating and attached framing in cargo holds of ships which by nature of their trade have their cargo hold hatches open during cold weather operations	I

Table 2.10.9 Steel grades for weather exposed plating

Thickness, t mm	Material Class I			
	PC1 to 5		PC6 and 7	
	MS	HT	MS	HT
$t \leq 10$	B	AH	B	AH
$10 < t \leq 15$	B	AH	B	AH

$45 < t \leq 50$	F	FH	F	FH	E	EH

Note Includes weather exposed plating of hull structures and appendages, as well as their outboard framing members, situated above a level of 0,3 m below the lowest ice waterline.

10.19 Longitudinal strength – Application

10.19.1 A ramming impact on the bow is the design scenario for the evaluation of the longitudinal strength of the hull.

10.19.2 Intentional ramming is not considered as a design scenario for ships which are designed with vertical side bow forms or bulbous bow forms, see Pt 8, Ch 2, 1.4 Application for multi-year ice conditions 1.4.4. Hence the longitudinal strength requirements given in Pt 8, Ch 2, 10.23 Longitudinal strength criteria are not to be considered for ships with stem angle γ_{stem} equal to or greater than 80°.

10.19.3 Ice loads are only to be combined with still water loads. The combined stresses are to be compared against permissible bending and shear stresses at different locations along the ship's length. In addition, sufficient local buckling strength is also to be verified.

10.20 Design vertical ice force at the bow

10.20.1 The design vertical ice force at the bow, F_{IB} , is to be taken as the lesser of $F_{\text{IB}, 1}$ or $F_{\text{IB}, 2}$:

$$F_{\text{IB}, 1} = 0.534 C_L K_I^{0,15} \sin^{0,2}(\gamma_s) \sqrt{\Delta_{\text{UI}}} K_h \text{ MN}$$

$$F_{\text{IB}, 2} = 1,2 C_F \text{ MN}$$

where

K_I = indentation parameter

$$= \frac{K_f}{K_h}$$

K_f = for blunt bow forms:

$$K_f = \left(\frac{2 C B_{\text{UI}} (1 - e_b)}{1 + e_b} \right)^{0,9} \tan(\gamma_s)^{-0,9(1 + e_b)}$$

for wedge bow forms ($\alpha_s < 80$ deg), $e_b = 1$ and the above simplifies to:

$$K_f = \left(\frac{\tan(\alpha_s)}{\tan^2(\gamma_s)} \right)^{0,9}$$

α_s = waterline angle measured in way of the stem at the upper ice waterline (UIWL), in degrees, see Figure 2.10.7 Bow shape definition

$$K_h = 0,01 A_{\text{wp}} \text{ MN/m}$$

C_L = longitudinal strength class factor from Table 2.10.1 Class factors for icebreaking bow forms

e_b = bow shape exponent which best describes the waterplane (see Figure 2.10.7 Bow shape definition and Figure 2.10.8 Illustration of effect on the bow shape e_b , for $B = 20$ and $L_B = 16$).

= An approximate e_b determined by a simple fit is acceptable

= 1,0 for a simple wedge bow form

= 0,4 to 0,6 for a spoon bow form

= 0 for a landing craft bow form

γ_s = stem angle to be measured between the horizontal axis and the stem tangent at the upper ice waterline, in degrees (buttock angle as per Figure 2.10.2 Definition of hull angles measured on the centreline)

$$C = \frac{1}{2 \left(\frac{L_B}{B_{UI}} \right)^{eb}}$$

B_{UI} = the greatest moulded breadth corresponding to the upper ice waterline (UIWL), in metres

L_B = bow length, in m, used in the equation:

Δ_{UI} = displacement as defined in *Pt 8, Ch 2, 10.1 Definitions 10.1.2*, in kilo tonnes, not to be taken less than 10

A_{wp} = waterplane area corresponding to the upper ice waterline (UIWL), in m²

C_F = flexural failure class factor from *Table 2.10.1 Class factors for icebreaking bow forms*

Figure 2.10.7 Bow shape definition

10.21 Design vertical shear force

10.21.1 The design vertical ice shear force, F_I , along the hull girder is to be taken as:

$$F_I = C_f F_B \text{ MN}$$

where

C_f = longitudinal distribution factor to be taken as follows:

(a) Positive shear force

$C_f = 0,0$ between the aft end of L_{UI} and $0,6L_{UI}$ from aft

$C_f = 1,0$ between $0,9L_{UI}$ from aft and the forward end of L_{UI}

(b) Negative shear force

$C_f = 0,0$ at the aft end of L_{UI}

$C_f = -0,5$ between $0,2L_{UI}$ and $0,6L_{UI}$ from aft

$C_f = 0,0$ between $0,8L_{UI}$ from aft and the forward end of L_{UI}

L_{UI} = length, as defined in Pt 8, Ch 2, 10.1 Definitions 10.1.2 in metres

Intermediate values are to be determined by linear interpolation.

10.21.2 The applied vertical shear stress, τ_a , is to be determined along the hull girder in a similar manner as in *Pt 3, Ch 4 Longitudinal Strength* by substituting the design vertical ice shear force for the design vertical wave shear force.

10.22 Design vertical ice bending moment

10.22.1 The design vertical ice bending moment, M_I , along the hull girder is to be taken as:

$$M_I = 0,1 C_m L_{UI} \sin^{-0,2}(\gamma_s) F_{IB} \text{ MNm}$$

where

L_{UI} = ship length as defined in *Pt 8, Ch 2, 10.1 Definitions 10.1.2* in metres.

γ_{stem} = as given in *Pt 8, Ch 2, 10.20 Design vertical ice force at the bow 10.20.1*

F_{IB} = design vertical ice force at the bow, in MN

C_m = longitudinal distribution factor for design vertical ice bending moment to be taken as follows:

$C_m = 0,0$ at the aft end of L_{UI}

$C_m = 1,0$ between $0,5L_{UI}$ and $0,7L_{UI}$ from aft

$C_m = 0,3$ at $0,95L_{UI}$ from aft

$C_m = 0,0$ at the forward end of L_{UI}

Intermediate values are to be determined by linear interpolation.

10.22.2 The applied vertical bending stress, σ_a , is to be determined along the hull girder in a similar manner as in *Pt 3, Ch 4 Longitudinal Strength*, by substituting the design vertical ice bending moment for the design vertical wave bending moment. The ship still water bending moment is to be taken as the permissible still water bending moment in sagging condition.

10.23 Longitudinal strength criteria

10.23.1 The strength criteria provided in *Table 2.10.12 Longitudinal strength criteria* are to be satisfied. The design stress is not to exceed the permissible stress.

Table 2.10.12 Longitudinal strength criteria

Failure mode	Applied stress	Permissible stress	Permissible stress
		$\frac{\sigma_y}{\sigma_u} \leq 0,7$	$\frac{\sigma_y}{\sigma_u} > 0,7$
Tension	σ_a	$\eta \sigma_y$	$\eta 0,41(\sigma_u + \sigma_y)$
Shear	τ_a	$\frac{\eta \sigma_y}{\sqrt{3}}$	$\frac{\eta 0,41(\sigma_u + \sigma_y)}{\sqrt{3}}$
Buckling	σ_a	σ for plating and for web plating of stiffeners	
		$\frac{\sigma_c}{1,1}$ for stiffeners	
	τ_a		τ_c
Symbols			
σ_a = applied vertical bending stress, in N/mm ²			

τ_a = applied vertical shear stress, in N/mm²

σ_y = minimum upper yield stress of the material, in N/mm²

σ_u = ultimate tensile strength of material, in N/mm²

σ_c = critical buckling stress in compression, according to Pt 3, Ch 4 Longitudinal Strength, in N/mm²

τ_c = critical buckling stress in shear, according to Pt 3, Ch 4 Longitudinal Strength, in N/mm²

η = 0,8

= 0,6 for ships which are assigned the additional notation **Icebreaker**

10.24 Stem and stern frames

10.24.1 The stem and stern frame are to be suitably designed. The stem and stern requirements of the *Finnish-Swedish Ice Class Rules* are to be additionally considered, see Pt 8, Ch 2, 1 *Strengthening requirements for navigation in ice – Application of requirements*.

10.25 Rudders

10.25.1 Rudder scantlings, posts, rudder horns, solepieces, rudder stocks, steering engines, and pintles are to be dimensioned in accordance with Pt 3, Ch 6 *Aft End Structure* and Pt 3, Ch 13 *Ship Control Systems* as appropriate. The speed used in the calculations is to be the maximum service speed or that given in Table 2.10.13 *Minimum speed*, whichever is the greater. When used in association with the speed given in Table 2.10.13 *Minimum speed*, the rudder profile coefficients are to be taken as 1,1.

10.25.2 For the astern condition the actual astern speed or half the minimum speed defined in Table 2.10.13 *Minimum speed* is to be used, whichever is greater.

10.25.3 The section modulus of the solepiece calculated in accordance with Pt 8, Ch 2, 10.25 *Rudders* 10.25.1 and Pt 8, Ch 2, 10.25 *Rudders* 10.25.2 need not be greater than three times the section modulus of the solepiece, calculated in accordance with Pt 3, Ch 13 *Ship Control Systems* using the actual maximum service speed.

10.25.4 Local scantlings of rudders are to be determined considering that the rudder belongs to the stern ice belt/ice belt lower, depending on rudder location with respect to the lower extent of the ice belt. Rudder local plating and framing located above the lower extent of the main ice belt are to be dimensioned using the stern ice belt area factor applicable to the relevant Polar Class. Rudder local plating and framing located below the lower extent of the main ice belt are to be dimensioned using the stern lower ice belt area factor applicable to the relevant Polar Class.

10.25.5 For scantlings of the rudder blade the plate thickness is to be determined in accordance with Pt 8, Ch 2, 10.10 *Shell plate requirements* using the rudder web frame spacing. The aspect ratio of the panel under consideration is to be used to determine the appropriate selection of formulae for transverse or longitudinally framed plating. Where the aspect ratio is 1,0, the panel is to be considered transversely framed.

10.25.6 The vertical and horizontal web thickness is not to be less than $0,7t_R$, but is not to be taken as less than 8 mm, where t_R is the rudder plate thickness.

10.25.7 The mainpiece is to be dimensioned in accordance with Pt 3, Ch 13 *Ship Control Systems*, utilising the basic stock diameter derived using in the minimum speed in Table 2.10.13 *Minimum speed*.

Table 2.10.13 Minimum speed

Ice Class	Minimum speed, in knots	Ice Class	Minimum speed, in knots
PC7	18	Icebreaker, PC7	22
PC6	20	Icebreaker, PC6	24

PC5	22	Icebreaker, PC5	28
PC4	25	Icebreaker, PC4	32
PC3	28	Icebreaker, PC3	35
PC2	31	Icebreaker, PC2	38
PC1	34	Icebreaker, PC1	42

10.26 Appendages

10.26.1 All appendages are to be designed to withstand forces appropriate for the location of their attachment to the hull structure or their position within a hull area.

10.27 Local details

10.27.1 Local design details are to be suitably designed to transfer ice-induced loads to supporting structure (bending moments and shear forces).

10.27.2 The loads carried by a member in way of cut-outs are not to cause instability. Where necessary, the structure is to be stiffened.

10.28 Direct calculations

10.28.1 Direct calculations are not to be utilised as an alternative to the analytical procedures prescribed for the shell plating and local frame requirements given in *Pt 8, Ch 2, 10.10 Shell plate requirements* to *Pt 8, Ch 2, 10.13 Framing – Longitudinal local frames in side structures*.

10.28.2 Direct calculations are to be used for load carrying stringers and web frames forming part of a grillage system.

10.28.3 Where direct calculation is used to check the strength of structural systems, the load patch specified in *Pt 8, Ch 2, 10.3 Design ice loads – General* is to be applied, without being combined with any other loads. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

10.28.4 The strength evaluation of web frames and stringers may be performed based on linear or non-linear analysis. Recognised structural idealisation and calculation methods are to be applied, see *Pt 3, Ch 1, 2 Direct calculations*. In the strength evaluation, the guidance given in *Pt 8, Ch 2, 10.28 Direct calculations 10.28.5* and *Pt 8, Ch 2, 10.28 Direct calculations 10.28.6* may generally be considered.

10.28.5 If the structure is evaluated based on linear calculation methods, the following are to be considered:

- (a) Web plates and flange elements in compression and shear to fulfil relevant buckling criteria in accordance with the applicable ShipRight SDA procedures. See *Pt 3, Ch 16, 3 Structural design assessment*.
- (b) Nominal shear stresses in member web plates to be less than $s_y/\sqrt{3}$
- (c) Nominal von Mises stresses in member flanges to be less than $1,15 s_y$

10.28.6 If the structure is evaluated based on non-linear calculation methods, the following are to be considered:

- (a) The analysis is to reliably capture buckling and plastic deformation of the structure.
- (b) The acceptance criteria are to ensure a suitable margin against fracture and major buckling and yielding causing significant loss of stiffness.
- (c) Permanent lateral and out-of plane deformation of considered member are to be minor relative to the relevant structural dimensions.

10.29 Welding

10.29.1 All welding within ice-strengthened areas is to be of the double continuous type.

10.29.2 Continuity of strength is to be ensured at all structural connections.

■ Section 11**Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker****11.1 Application**

11.1.1 The contents of this Section apply to main propulsion, steering gear, emergency and essential auxiliary systems essential for the safety of the ship and the survivability of the crew and systems and equipment required by assigned optional classification notations, e.g. navigational equipment associated with the notations **NAV1** or **IBS**.

11.1.2 For **PC6** and **PC7**, the requirements will be considered with respect to compliance with the *Finnish - Swedish Ice Class Rules*.

11.2 Drawings and particulars to be submitted

11.2.1 The following drawings and particulars to be submitted:

- (a) Details of the environmental conditions and the required ice class for the machinery, if different from ship's ice class.
- (b) Detailed drawings of the main propulsion machinery. Description of the main propulsion, steering, emergency and essential auxiliaries are to include operational limitations. Information on essential main propulsion load control functions.
- (c) Description detailing how main, emergency and auxiliary systems are located and protected to prevent problems from freezing, ice and snow and evidence of their capability to operate in intended environmental conditions.
- (d) Calculations and documentation indicating compliance with the requirements of this Section.

11.3 System design

11.3.1 Systems, subject to damage by freezing, are to be drainable.

11.3.2 Single screw vessels classed PC1 to PC5 inclusive are to have means provided to ensure sufficient vessel operation in the case of propeller damage including CP mechanism.

11.4 Materials exposed to sea-water

11.4.1 Materials exposed to sea-water, such as propeller blades, propeller hub and blade bolts are to have an elongation not less than 15 per cent on a test piece the length of which is five times the diameter. Charpy V impact test are to be carried out for other than bronze and austenitic steel materials. Test pieces taken from the propeller castings are to be representative of the thickest section of the blade. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at minus 10°C.

11.5 Materials exposed to sea-water temperature

11.5.1 Materials exposed to sea-water temperature are to be of steel or other approved ductile material. An average impact energy value of 20 J taken from three tests is to be obtained at minus 10°C.

11.6 Materials exposed to low air temperature

11.6.1 Materials of essential components exposed to low air temperature shall be of steel or other approved ductile material. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at 10°C below the lowest design temperature. *See also the Rules for the Winterisation of Ships, July 2021.*

11.7 Propeller ice interaction

11.7.1 These Rules cover open and ducted type propellers situated at the stern of a vessel having controllable pitch or fixed pitch blades. Ice loads on bow propellers and pulling type propellers are to receive special consideration. The given loads are expected, single occurrence, maximum values for the whole ship's service life for normal operational conditions. These loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. These Rules apply also for azimuthing (geared and podded) thrusters considering loads due to propeller ice interaction. However, ice loads due to ice impacts on the body of azimuthing thrusters are not covered by this Section.

Ice Operations - Ice Class

Part 8, Chapter 2

Section 11

11.7.2 The loads given in Pt 8, Ch 2, 11.7 *Propeller ice interaction* are total loads (unless otherwise stated) during ice interaction and are to be applied separately (unless otherwise stated) and are intended for component strength calculations only. The different loads given here are to be applied separately.

11.7.3 F_b is a force bending a propeller blade backwards when the propeller mills an ice block while rotating ahead. F_f is a force bending a propeller blade forwards when a propeller interacts with an ice block while rotating ahead.

11.8 Ice class factors

11.8.1 Table 2.11.1 *Propeller ice loads index* lists the design ice thickness and ice strength index to be used for estimation of the propeller ice loads.

Table 2.11.1 Propeller ice loads index

Ice Class	H_{ice} , in metres	S_{ice}	S_{qice}
PC1	4,0	1,2	1,15
PC2	3,5	1,1	1,15
PC3	3,0	1,1	1,15
PC4	2,5	1,1	1,15
PC5	2,0	1,1	1,15
PC6	1,75	1,0	1,00
PC7	1,5	1,0	1,00

where

H_{ice} = ice thickness for machinery strength design

S_{ice} = ice strength index for blade ice force

S_{qice} = ice strength index for blade ice torque

11.9 Design ice loads for open propeller

11.9.1 The maximum backward blade force, F_b , is to be taken as:

when $D < D_{limit}$

$$F_b = -27 S_{ice} (nD)^{0,7} \left(\frac{EAR}{Z} \right)^{0,3} D^2 \text{ kN}$$

when $D \geq D_{limit}$

$$F_b = -23 S_{ice} (nD)^{0,7} \left(\frac{EAR}{Z} \right)^{0,3} (H_{ice})^{1,4} D \text{ kN}$$

where

$$D_{limit} = 0,85 (H_{ice})^{1,4}$$

n = the nominal rotational speed in rev/sec (at MCR free running condition) for CP-propeller and 85 per cent of the nominal rotational speed (at MCR free running condition) for a FP-propeller (regardless of driving engine type).

11.9.2 F_b is to be applied as a uniform pressure distribution to an area on the back (suction) side of the blade for the following load cases:

(a) Load case 1: from 0,6R to the tip and from the blade leading edge to a value of 0,2 chord length

- (b) Load case 2: a load equal to 50 per cent of the F_b is to be applied on the propeller tip area outside of $0,9R$
- (c) Load case 5: for reversible propellers, a load equal to 60 per cent of the F_b is to be applied from $0,6R$ to the tip and from the blade trailing edge to a value of $0,2$ chord length.

See load cases 1, 2, and 5 in *Table 2.11.4 Load cases for open propeller*.

11.9.3 The maximum forward blade force, F_f , is to be taken as:

when $D < D_{\text{limit}}$

$$F_f = 250 \left(\frac{EAR}{Z} \right) D^2 \text{ kN}$$

when $D \geq D_{\text{limit}}$

$$F_f = 500 \left(\frac{1}{1 - \frac{d}{D}} \right) H_{\text{ice}} \left(\frac{EAR}{Z} \right) D \text{ kN}$$

where

$$D_{\text{limit}} = \left(\frac{2}{1 - \frac{d}{D}} \right) H_{\text{ice}} \text{ m}$$

d = propeller hub diameter, in metres

D = propeller diameter, in metres

EAR = expanded blade area ratio

Z = number of propeller blades.

11.9.4 F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side of the blade for the following load cases:

- (a) Load case 3: from $0,6R$ to the tip and from the blade leading edge to a value of $0,2$ chord length.
- (b) Load case 4: a load equal to 50 per cent of F_f is to be applied on the propeller tip area outside of $0,9R$.
- (c) Load case 5: for reversible propellers a load equal to 60 per cent of F_f is to be applied from $0,6R$ to the tip and from the blade trailing edge to a value of $0,2$ chord length.

See load cases 3, 4, and 5 in *Table 2.11.4 Load cases for open propeller*.

11.9.5 The blade spindle torque, Q_{smax} , around the spindle axis of the blade fitting is to be calculated both for the load cases described in *Pt 8, Ch 2, 11.9 Design ice loads for open propeller 11.9.1* and *Pt 8, Ch 2, 11.9 Design ice loads for open propeller 11.9.3* for F_h and F_f . If these spindle torque values are less than the default value given below, the default minimum value is to be used:

$$Q_{\text{smax}} = 0,25 F_{C_{0,7}} \text{ kNm}$$

where

$C_{0,7}$ = length of the blade chord at $0,7R$ radius, in m

$F = F_h$ or F_f whichever has the greater absolute value.

11.9.6 The maximum propeller ice torque applied to the propeller is to be taken as:

when $D < D_{\text{limit}}$

$$Q_{\text{max}} = 105 \left(1 - \frac{d}{D} \right) S_{\text{qice}} \left(\frac{P_{0,7}}{D} \right)^{0,16} \left(\frac{t_{0,7}}{D} \right)^{0,6} (nD)^{0,17} D^3 \text{ kNm}$$

when $D \geq D_{\text{limit}}$

$$Q_{\max} = 202 \left(1 - \frac{d}{D}\right) S_{\text{qice}} H_{\text{ice}}^{1,1} \left(\frac{P_{0,7}}{D}\right)^{0,16} \left(\frac{t_{0,7}}{D}\right)^{0,6} (nD)^{0,17} D^{1,9} \text{ kNm}$$

where

$$D_{\text{limit}} = 1,81 H_{\text{ice}}$$

S_{qice} = ice strength index for blade ice torque

$P_{0,7}$ = propeller pitch at 0,7R, in m

= for CP propellers, $P_{0,7}$ is to correspond to MCR in bollard condition. If not known, $P_{0,7}$ is to be taken as $0,7P_{0,7n}$

$P_{0,7n}$ = propeller pitch at MCR free running condition

$t_{0,7}$ = maximum thickness at 0,7R

n = the rotational propeller speed, in rev/sec, at bollard condition. If not known, n is to be taken as follows:
for CP propellers and FP propellers driven by turbine or electric motor = n_n

for FP = $0,85n_n$
propellers
driven by
engine

n_n = the nominal rotational speed at MCR, free running condition.

11.9.7 The maximum propeller ice thrust applied to the shaft is to be taken as:

$$T_f = 1,1 F_t$$

$$T_b = 1,1 F_b.$$

11.10 Design ice loads for ducted propellers

11.10.1 The maximum backward blade force, F_b is to be taken as:

when $D < D_{\text{limit}}$

$$F_b = -9,5 S_{\text{ice}} \left(\frac{EAR}{Z}\right)^{0,3} (nD)^{0,7} D^2$$

when $D \geq D_{\text{limit}}$

$$F_b = -66 S_{\text{ice}} \left(\frac{EAR}{Z}\right)^{0,3} (nD)^{0,7} D^{0,6} (H_{\text{ice}})^{1,4}$$

where

$$D_{\text{limit}} = 4 H_{\text{ice}}$$

n = as in Pt 8, Ch 2, 11.9 Design ice loads for open propeller 11.9.1.

11.10.2 F_b is to be applied as a uniform pressure distribution to an area on the back side for the following load cases:

- (a) Load case 1: on the back of the blade from 0,6R to the tip and from the blade leading edge to a value of 0,2 chord length
- (b) Load case 5: for reversible rotation propellers a load equal to 60 per cent of F_b is applied on the blade face from 0,6R to the tip and from the blade trailing edge to a value of 0,2 chord length.

See load cases 1 and 5 in Table 2.11.5 Load cases for ducted propeller.

11.10.3 The maximum forward blade force, F_f , is to be taken as:

when $D \leq D_{\text{limit}}$

$$F_f = 250 \left(\frac{EAR}{Z} \right) D^2 \text{ kN}$$

when $D > D_{\text{limit}}$

$$F_f = 500 \left(\frac{EAR}{Z} \right) D \left(\frac{1}{1 - \frac{d}{D}} \right) H_{\text{ice}} \text{ kN}$$

where

$$D_{\text{limit}} = \left(\frac{2}{1 - \frac{d}{D}} \right) H_{\text{ice}} \text{ m.}$$

11.10.4 F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side for the following load cases:

- (a) Load case 3: on the blade face from $0,6R$ to the tip and from the blade leading edge to a value of $0,5$ chord length.
- (b) Load case 5: a load equal to 60 per cent F_f is to be applied from $0,6R$ to the tip and from the blade leading edge to a value of $0,2$ chord length.

See load cases 3 and 5 in *Table 2.11.5 Load cases for ducted propeller*.

11.10.5 The maximum propeller ice torque, Q_{max} , applied to the propeller is to be taken as:

when $D \leq D_{\text{limit}}$

$$Q_{\text{max}} = 74 \left(1 - \frac{d}{D} \right) \left(\frac{P_{0,7}}{D} \right)^{0,16} \left(\frac{t_{0,7}}{D} \right)^{0,6} (nD)^{0,17} S_{qice} D^3 \text{ kNm}$$

when $D > D_{\text{limit}}$

$$Q_{\text{max}} = 141 \left(1 - \frac{d}{D} \right) \left(\frac{P_{0,7}}{D} \right)^{0,16} \left(\frac{t_{0,7}}{D} \right)^{0,6} (nD)^{0,17} S_{qice} D^{1,9} H_{\text{ice}}^{1,1} \text{ kNm}$$

where

$$D_{\text{limit}} = 1,8 H_{\text{ice}} \text{ in metres}$$

n = the rotational propeller speed, in rps, at bollard condition. If not known, n is to be taken as follows: for CP propellers and FP propellers driven by turbine or electric motor = n_n

for FP
propellers
driven by
engine

$$\text{for FP} = 0,85 n_n$$

n_n = the nominal rotational speed at MCR at free running condition

$P_{0,7}$ = for CP propellers, propeller pitch, $P_{0,7}$ is to correspond to MCR in bollard condition. If not known, $P_{0,7}$ is to be taken as $0,7 P_{0,7n}$

$P_{0,7n}$ = propeller pitch at MCR free running condition.

11.10.6 The spindle torque for CP-mechanism design, Q_{smax} , around the spindle axis of the blade fitting is to be calculated for the load case described in *Pt 8, Ch 2, 11.7 Propeller ice interaction*. If these spindle torque values are less than the default value given below, the default value is to be used:

$$Q_{\text{smax}} = 0,25 F C_{0,7} \text{ kNm}$$

where

$C_{0,7}$ = the length of the blade section at $0,7R$

$F = F_b$ or F_f whichever has the greater absolute value.

11.10.7 The maximum propeller ice thrust (applied to the shaft at the location of the propeller) is to be taken as:

$$T_f = 1,1F_f$$

$$T_b = 1,1F_b.$$

11.11 Design loads on propulsion line – Torque

11.11.1 The propeller ice torque excitation for shaft line dynamic analysis is to be described by a sequence of blade impacts which are of half sine shape and occur at the blade. The torque due to a single blade ice impact as a function of the propeller rotation angle is to be taken as:

when $\varphi = 0 \dots \alpha_i$

$$Q(\varphi) = C_q Q_{\max} \sin\left(\varphi \left(\frac{180}{\alpha_i}\right)\right)$$

when $\varphi = \alpha_i \dots 360$

$$Q(\varphi) = 0$$

where

C_q = as given in Table 2.11.2 Torque load factors

α_i = as given in Table 2.11.2 Torque load factors.

Table 2.11.2 Torque load factors

Torque excitation	Propeller-ice interaction	C_q	α_i
Case 1	Single ice block	0,50	45
Case 2	Single ice block	0,75	90
Case 3	Single ice block	1,00	135
Case 4	Two ice blocks with 45 degree phase in rotation angle	0,50	45

11.11.2 The total ice torque is obtained by summing the torque of single blades taking into account the phase shift $360^\circ/Z$. The number of propeller revolutions during a milling sequence is to be obtained with the formula:

$$N_Q = 2H_{\text{ice}}$$

where

number of impacts = $Z N_Q$ see Figure 2.11.1 The shape of the propeller ice torque excitation for 45, 90, 135 degrees single blade impact sequences and 45 degrees double blade impact sequence (two ice pieces) on a four bladed propeller.

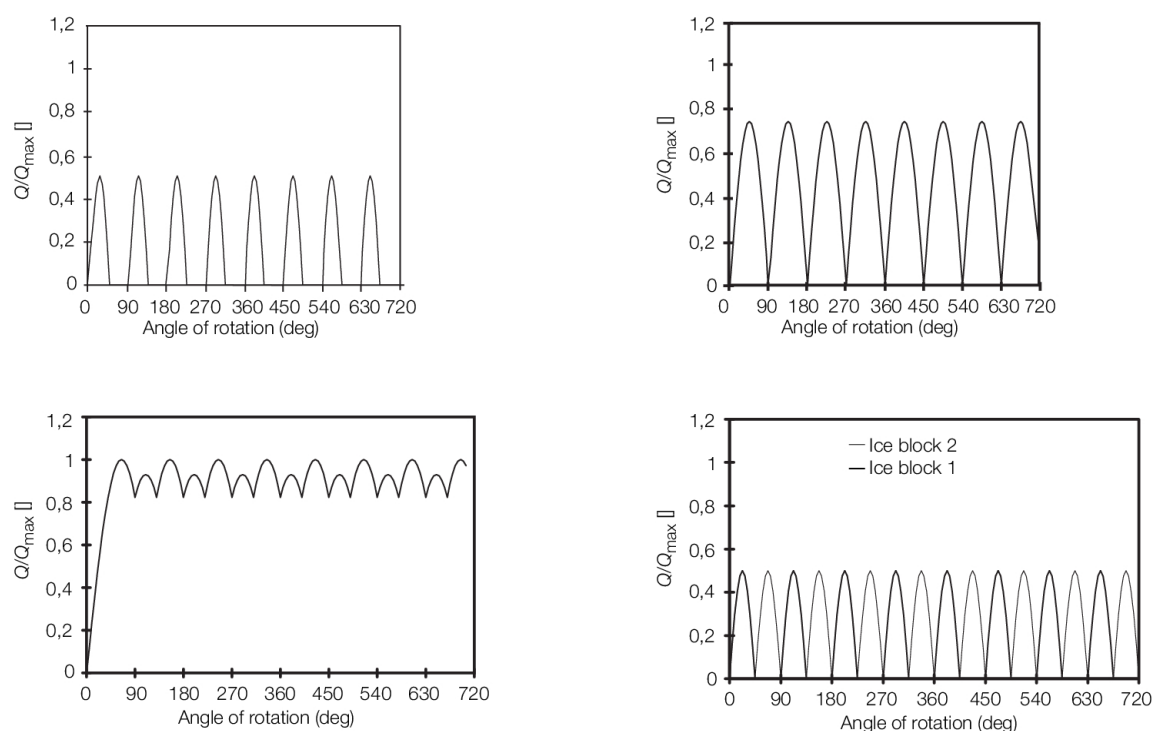

Figure 2.11.1 The shape of the propeller ice torque excitation for 45, 90, 135 degrees single blade impact sequences and 45 degrees double blade impact sequence (two ice pieces) on a four bladed propeller

11.11.3 The milling torque sequence duration is not valid for pulling bow propellers, which are subject to special consideration. The response torque at any shaft component is to be analysed considering excitation torque $Q(\varphi)$ at the propeller, actual engine torque, Q_e , and mass elastic system. Where Q_e is the actual maximum engine torque at considered speed.

11.11.4 The design torque, Q_r , of the shaft component is to be determined by means of torsional vibration analysis of the propulsion line. Calculations are to be carried out for all excitation cases given above and the response is to be applied on top of the mean hydrodynamic torque in bollard condition at considered propeller rotational speed.

11.12 Design loads on propulsion line – Maximum response thrust

11.12.1 The maximum thrust along the propeller shaft line is to be calculated with the formulae below. The factors 2,2 and 1,5 take into account the dynamic magnification due to axial vibration. Alternatively, the propeller thrust magnification factor may be calculated by dynamic analysis.

Maximum shaft thrust forwards

$$T_r = T_n + 2,2T_f \text{ kN}$$

Maximum shaft thrust backwards

$$T_r = 1,5T_b \text{ kN}$$

where

T_n = hydrodynamic propeller bollard thrust, in kN. If not known, T_n is to be as given in *Table 2.11.3 Propeller thrust factor*

T_f = maximum forward propeller ice thrust, in kN.

Table 2.11.3 Propeller thrust factor

Propeller type	T_n
CP propellers (open)	$1,25T$
CP propellers (ducted)	$1,10T$
FP propellers driven by turbine or electric motor	T
FP propellers driven by engine (open)	$0,85T$
FP propellers driven by engine (ducted)	$0,75T$
Symbols	
T = nominal propeller thrust at MCR at free running open water conditions	

Table 2.11.4 Load cases for open propeller

Load case	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from $0,6R$ to the tip and from the leading edge to $0,2$ times the chord length.	
Load case 2	50% of F_b	Uniform pressure applied on the back of the blade (suction side) on the propeller tip area outside of $0,9R$ radius.	
Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from $0,6R$ to the tip and from the leading edge to $0,2$ times the chord length.	

Load case 4	50% of F_f	Uniform pressure applied on propeller face (pressure side) on the propeller tip area outside of $0,9R$ radius.	
Load case 5	60% of F_f or F_b whichever is the greater	Uniform pressure applied on propeller face (pressure side) to an area from $0,6R$ to the tip and from the trailing edge to $0,2$ times the chord length.	

Table 2.11.5 Load cases for ducted propeller

Load case	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from $0,6R$ to the tip and from the leading edge to $0,2$ times the chord length	
Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from $0,6R$ to the tip and from the leading edge to $0,5$ times the chord length	
Load case 5	60% of F_f or F_b	Uniform pressure applied on propeller face (pressure side) to an area from $0,6R$ to the tip and from the trailing edge to $0,2$ times the chord length	

11.13 Design loads on propulsion line – Blade failure load for both open and nozzle propellers

11.13.1 The force is acting at $0,8R$ in the weakest direction of the blade and at a spindle arm of $2/3$ of the distance of axis of blade rotation of leading and trailing edge whichever is the greatest. The blade failure load is to be taken as:

$$F_{ex} = \frac{0,3c t^2 \sigma_{ref}}{0,8D - 2r} \times 10^3 \text{ kN}$$

where

$$\sigma_{ref} = 0,6\sigma_{0,2} + 0,4\sigma_u$$

$\sigma_{0,2}$ and σ_u = representative values for the blade material

c , t and r = the actual chord length, thickness and radius of the cylindrical root section of the blade at the weakest section outside root fillet and typically will be at the termination of the fillet into the blade profile.

11.14 Design – Design principle

11.14.1 The strength of the propulsion line is to be designed:

- (a) for maximum loads in *Pt 8, Ch 2, 11.7 Propeller ice interaction*;
- (b) such that the plastic bending of a propeller blade will not cause damage in other propulsion line components;
- (c) with sufficient fatigue strength.

11.15 Design – Azimuthing main propulsors

11.15.1 In addition to the above requirements, special consideration will be given to the loading cases which are extraordinary for propulsion units when compared with conventional propellers. Estimation of the loading cases must reflect the operational realities of the ship and the thrusters. In this respect, for example, the loads caused by impacts of ice blocks on the propeller hub of a pulling propeller are to be considered. Also, loads due to thrusters operating in an oblique angle to the flow are to be considered. The steering mechanism, the fitting of the unit and the body of the thruster is to be designed to withstand the loss of a blade without damage. The plastic bending of a blade is to be considered in the propeller blade position, which causes the maximum load on the studied component.

11.15.2 Azimuth thrusters are also to be designed for estimated loads due to thruster body/ice interaction as in *Pt 8, Ch 2, 10.26 Appendages*.

11.16 Blade design – Maximum blade stresses

11.16.1 Blade stresses are to be calculated using the backward and forward loads given in sub-Sections *Pt 8, Ch 2, 11.9 Design ice loads for open propeller* and *Pt 8, Ch 2, 11.10 Design ice loads for ducted propellers*. The stresses are to be calculated with recognised and well documented FE-analysis or another acceptable alternative method. The stresses on the blade are not to exceed the allowable stresses, σ_{all} , for the blade material given below. The calculated blade stress for the maximum ice load is to comply with the following:

$$\sigma_{calc} < \sigma_{all} = \frac{\sigma_{ref}}{S}$$

where

$$S = 1,5$$

σ_{ref} = reference stress, defined as:

$$= 0,7\sigma_u$$

$$= 0,6\sigma_{0,2} + 0,4\sigma_u \text{ whichever is less}$$

σ_u and $\sigma_{0,2}$ = representative values for the blade material.

11.17 Blade design – Blade edge thickness

11.17.1 The blade edge thicknesses, t_{ed} , and tip thickness t_{tip} , are to be greater than t_{edge} given by the following formula:

$$t_{edge} \geq x S S_{ice} \sqrt{\frac{3P_{ice}}{\sigma_{ref}}}$$

where

x = distance from the blade edge measured along the cylindrical sections from the edge and is to be 2,5 per cent of chord length, however not to be taken greater than 45 mm.

= In the tip area (above $0,975R$ radius) x is to be taken as 2,5 per cent of $0,975R$ section length and is to be measured perpendicularly to the edge, however not to be taken greater than 45 mm.

S = safety factor

= 2,5 for trailing edges

= 3,5 for leading edges

= 5,0 for tip

S_{ice} = as given in *Pt 8, Ch 2, 11.8 Ice class factors*

P_{ice} = ice pressure

= 16 MPa for leading edge and tip thickness

σ_{ref} = as given in *Pt 8, Ch 2, 11.16 Blade design – Maximum blade stresses*.

11.17.2 The requirement for edge thickness is to be applied for leading edge and in case of reversible rotation open propellers also for the trailing edge. Tip thickness refers to the maximum measured thickness in the tip area above $0,975R$ radius. The edge thickness in the area between the position of maximum tip thickness and edge thickness at $0,975$ radius has to be interpolated between edge and tip thickness value and smoothly distributed.

11.18 Prime movers

11.18.1 The main engine is to be capable of being started and running the propeller with the CP in full pitch.

11.18.2 Provisions are to be made for heating arrangements to ensure ready starting of the cold emergency power units at an ambient temperature applicable to the Polar class of the ship.

11.18.3 Emergency power units are to be equipped with starting devices with a stored energy capability of at least three consecutive starts at the design temperature in *Pt 8, Ch 2, 11.18 Prime movers 11.18.2*. The source of stored energy is to be protected to preclude critical depletion by the automatic starting system, unless a second independent means of starting is provided. A second source of energy is to be provided for an additional three starts within 30 min., unless manual starting can be demonstrated to be effective.

11.19 Machinery fastening loading accelerations

11.19.1 Essential equipment and main propulsion machinery supports are to be suitable for the accelerations as indicated in the following. Accelerations are to be considered acting independently.

11.19.2 The maximum longitudinal impact acceleration, a_l , at any point along the hull girder is to be taken as:

$$a_l = \left(\frac{F_{IB}}{A} \right) \left\{ [1, 1 \tan(\gamma + \varphi)] + \frac{7H}{L} \right\} \text{ m/s}^2$$

where

F_{IB} = vertical impact force, defined in *Pt 8, Ch 2, 10.20 Design vertical ice force at the bow*

H = distance from the waterline to the point being considered, in metres

L = length between perpendiculars, in metres

φ = maximum friction angle between steel and ice, normally taken as 10, in degrees

γ = bow stem angle at waterline, in degrees

Δ = Displacement.

11.19.3 The combined vertical impact acceleration, a_v , at any point along the hull girder, is to be taken as:

$$a_v = 2,5 \left(\frac{F_{IB}}{\Delta} \right) F_x \text{ m/s}^2$$

where

F_x = 1,3 at the FP

= 0,2 at midships

= 0,4 at the AP

= 1,3 at the AP for vessels conducting icebreaking astern

intermediate values are to be determined by linear interpolation.

11.19.4 The combined transverse impact acceleration, a_t , at any point along hull girder, is to be taken as:

$$a_t = 3F_i \left(\frac{F_x}{\Delta} \right) \text{ m/s}^2$$

where

F_x = 1,5 at the FP

= 0,25 at midships

= 0,5 at the AP

= 1,5 at the AP for vessels conducting icebreaking astern

intermediate values are to be determined by linear interpolation

F_i = total force normal to shell plating in the bow area due to oblique ice impact, defined in *Pt 8, Ch 2, 10.5 Bow area 10.5.3.(b)*.

11.20 Auxiliary systems

11.20.1 Machinery is to be protected from the harmful effects of ingestion or accumulation of ice or snow. Where continuous operation is necessary, means are to be provided to purge the system of accumulated ice or snow.

11.20.2 Means are to be provided to prevent damage due to freezing, to tanks containing liquids.

11.20.3 Vent pipes, intake and discharge pipes and associated systems are to be designed to prevent blockage due to freezing or ice and snow accumulation.

11.21 Sea inlets and cooling water systems

11.21.1 Cooling water systems for machinery that are essential for the propulsion and safety of the vessel, including sea chest inlets, are to be designed for the environmental conditions applicable to the ice class.

11.21.2 At least two sea chests are to be arranged as ice boxes for classes **PC1** to **PC5** inclusive. The calculated volume for each of the ice boxes is to be at least 1 m³ for every 750 kW of the total installed power. For **PC6** and **PC7**, there is to be at least one ice box located preferably near centreline.

11.21.3 Ice boxes are to be designed for an effective separation of ice and venting of air.

11.21.4 Sea inlet valves are to be secured directly to the ice boxes. The valves are to be a full bore type.

11.21.5 Ice boxes and sea bays are to have vent pipes and are to have shut off valves connected directly to the shell.

11.21.6 Means are to be provided to prevent freezing of sea bays, ice boxes, ship side valves and fittings above the load waterline.

11.21.7 Efficient means are to be provided to re-circulate cooling seawater to the ice box. The total sectional area of the circulating pipes is not to be less than the area of the cooling water discharge pipe.

11.21.8 Detachable gratings or manholes are to be provided for ice boxes. Manholes are to be located above the deepest load line. Access is to be provided to the ice box from above.

11.21.9 Openings in ship sides for ice boxes are to be fitted with gratings, or holes or slots in shell plates. The net area through these openings is to be not less than 5 times the area of the inlet pipe. The diameter of holes and width of slot in shell plating is to be not less than 20 mm. Gratings of the ice boxes are to be provided with a means of clearing. Clearing pipes are to be provided with screw-down type non-return valves.

11.22 Ballast tanks

11.22.1 Efficient means are to be provided to prevent freezing in fore and after peak tanks and wing tanks located above the waterline and where otherwise found necessary. See *Pt 8, Ch 2, 2.1 General 2.1.3* and the *Rules for the Winterisation of Ships, July 2021, Ch 1, 3.2 Documentation 3.2.1*.

11.23 Ventilation system

11.23.1 The air intakes for machinery and accommodation ventilation are to be located on both sides of the ship.

11.23.2 Accommodation and ventilation air intakes are to be provided with means of heating.

11.23.3 The temperature of the inlet air provided to machinery from the air intakes is to be suitable for the safe operation of the machinery.

11.24 Steering arrangements

11.24.1 The steering gear for ships assigned the notation **Icebreaker** should be designed such that the rudder is centred automatically, immediately before the ship goes astern.

11.24.2 The effective holding torque of the rudder actuator, at safety valve set pressure, is obtained by multiplying the open water torque requirements (Q_R) at open water design speed (maximum 18 knots) determined from *Pt 3, Ch 13, 2 Rudders*, by the factor obtained from *Table 2.11.6 Steering gear holding torque factor*.

Table 2.11.6 Steering gear holding torque factor

Ice Class	PC1	PC2	PC3	PC4	PC5	PC6	PC7
Holding torque factor	5	5	3	3	3	2	1,5

11.24.3 The rudder actuator is to be protected by torque relief arrangements, assuming the turning speeds obtained from *Table 2.11.7 Rudder turning speed for relief valve discharge capacity* without undue pressure rise.

Table 2.11.7 Rudder turning speed for relief valve discharge capacity

Ice Class	PC1, PC2	PC3, PC4, PC5	PC6, PC7
Rudder turning speed (degrees/second)	8	6	4

11.24.4 For icebreakers, additional fast acting torque relief arrangements (acting at 15 per cent higher pressure than the set pressure of safety valves in *Pt 8, Ch 2, 11.24 Steering arrangements 11.24.2*) are to provide effective protection of the rudder actuator in case the rudder is pushed rapidly hard over against the stops assuming the turning speeds obtained from *Table 2.11.8 Rudder turning speed for fast acting relief valve discharge capacity*. The arrangement is to be such that steering capacity is readily regained. Fast acting torque relief arrangements are recommended for ships without the **Icebreaker** notation.

Table 2.11.8 Rudder turning speed for fast acting relief valve discharge capacity

Ice Class	PC1, PC2	PC3, PC4, PC5	PC6, PC7
Rudder turning speed (degrees/second)	40	20	10

11.25 Alternative design

11.25.1 As an alternative a comprehensive design study may be submitted and may be requested to be validated by an agreed test programme.

■ Section 12

Requirements for Icebreaker(+)

12.1 Scope

12.1.1 Where the notation **Icebreaker(+)** is assigned, the arrangement, powering and scantlings of the hull structure and propulsion machinery are to be determined based on the operational profile that corresponds to that which the icebreaker is envisaged to undertake as determined in the ship specific scenario document.

12.1.2 The assignment of the notation **Icebreaker(+)** is in addition to the requirements of *Pt 8, Ch 2, 10 Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and *Pt 8, Ch 2, 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and is assigned in addition to the ice class notations given in *Table 2.1.1 Polar class descriptions*. See *Pt 8, Ch 2, 1.5 Icebreakers*.

12.2 Operational profile

12.2.1 The operational profile to be used for the basis of assignment of the notation **Icebreaker(+)** is to be derived from the icebreaker's function, as selected from *Pt 8, Ch 2, 12.4 Typical operational profiles*.

12.2.2 The operational profile is only used to select a design basis. It is the responsibility of the Owner and/or Builder to determine the appropriate operational profile of the icebreaker.

12.3 Information to be submitted

12.3.1 For assignment of the notation **Icebreaker(+)**, the operational envelope criteria are to be submitted, which may include the following information, where applicable:

- (a) the level icebreaking capability, in terms of speed and ice thickness;
- (b) the turning capability in level ice, in terms of diameter and ice thickness; and
- (c) the ramming capability, in terms of speed and ice condition.

12.3.2 In addition to the information submitted in *Pt 8, Ch 2, 12.3 Information to be submitted 12.3.1*, a scenario document, which is ship specific, is required to document the operational profile and is to include details of the scenarios selected for deriving and applying ice loads.

12.3.3 The scenario document is to address the requirements in *Pt 8, Ch 2, 10 Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and *Pt 8, Ch 2, 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker* and provide justification for deviation from those requirements.

12.3.4 The following is to be contained within the submitted scenario document:

- (a) icebreaker function;
- (b) details of ice conditions assumed;
- (c) operational scenarios for hull and propulsion machinery;
- (d) identification of critical hull and propulsion machinery scenarios;

- (e) description of propulsion machinery and/or hull loading areas with reasons for selection;
- (f) proposed strengthening standards for each load area;
- (g) arrangement of propulsion devices;
- (h) derived load data-based full scale measurement or other predictive means; and
- (i) details of, and justification for, deviation from the Rules.

12.3.5 In addition to the information submitted in *Pt 8, Ch 2, 12.3 Information to be submitted 12.3.4*, an ice pressure plan that indicates the design ice pressures used for the determination of the hull structure is to be submitted.

12.3.6 The operational envelope criteria is to be placed on board the ship.

12.4 Typical operational profiles

12.4.1 Typical operational profiles may be derived from the icebreaker function. Primary icebreaker functions are described in *Table 2.12.1 Primary icebreaker functions*. These functions are to form the basis of operational scenarios as required in *Pt 8, Ch 2, 12.3 Information to be submitted 12.3.4*. Where an alternative function is selected a description of the icebreaker's operational functions is to be included in the scenario document.

Table 2.12.1 Primary icebreaker functions

Primary function	General description	Assumed criticality of operation
Escort	Engaged in icebreaker fleet operations in ice, patrol and search/ rescue missions Breaking channel for supporting other ships, close manoeuvring, freeing of beset vessels and, where appropriate, towing vessels	May attempt to follow easiest course when operating alone. Search and rescue operations are undertaken within the bounds of safe operation to the icebreaker and escorted ship
Research	Engaged in independent operations in ice, including deployment of scientists and research equipment Breaking of channels to reach scientific/ research bases and escort of ships for re-supply purposes	May re-route or re-schedule to avoid perceived difficult ice conditions
Support	Engaged in independent or icebreaker fleet operations in ice, supply/transit runs to support offshore installations Ice management activities which may include breaking of ice floes and engagement in ice defence of offshore operations/installations	May actively break large/strong ice features to defend the installation

12.5 General arrangement

12.5.1 Consideration is to be given to the protection of fuel tanks and other tanks with harmful substances, both in terms of thermal insulation and ice impact protection. A double bottom and double side tanks are to be fitted as specified in *Pt 4, Ch 9, 1.2 Application and ship arrangement 1.2.17*. However, double side tanks may not be required for small icebreakers (typically less than 60 m), nor complete double bottom height in way of complex hullform arrangements in the fore and aft ends or heeling tanks.

12.5.2 Consideration is to be given to minimise transom sterns, as these hinder the icebreaker's ability to back in ice, and in particular the navigation of ice ridges. A transom stern should not normally extend below the Upper Ice Waterline. Where this cannot be avoided, the transom should be kept as narrow as possible and the scantlings of plating and stiffeners are to be as required for the stern section.

12.5.3 The requirements are based on an effective icebreaker bow form. Icebreaking angles vary depending on the icebreaking form; however, in general, the bow stem angle is not to be greater than 45°, and the bow waterline angle not greater than 40°, see *Figure 2.12.1 Icebreaker stem angles*. Where flare of the side shell amidships is proposed, it is recommended that the slope of the side be at least 8°.

12.5.4 Ice arresters (ice skeg) are recommended for all icebreakers to prevent riding up of the bow and submergence of the aftermost deck edge.

12.5.5 For icebreakers provided with a heel inducing system, it is recommended that the depth of the icebreaker be such that immersion of the deck edge does not occur when the ship, whilst floating at the Upper Ice Waterline, is heeled to an angle of 5° greater than the nominal capacity of the system or 15°, whichever is the greater.

12.5.6 For icebreakers intended to navigate continuously in thick multi-year ice, i.e. PC1, PC2 and PC3, and in relation to the icebreaker function, consideration should be given to the mass of the icebreaker to enable effective ice breaking.

12.5.7 For icebreakers installed with podded propulsion or azimuth thrusters, see the *Rules for the Classification of Stern First Ice Class Ships, July 2021*

12.6 Hull strength

12.6.1 An ice pressure plan is to be submitted as required in *Pt 8, Ch 2, 12.3 Information to be submitted 12.3.5*. The ice pressure is to consider the adjustment of area factors for additional ice interaction scenarios as well as the crushing failure class factors due to the increased impact speed as well as application with due cognisance of low displacements.

12.6.2 The area factors associated with the ice pressure plan in *Pt 8, Ch 2, 12.6 Hull strength 12.6.1* are, as a minimum, to comply with the hull area factors given in *Table 2.10.4 Hull area factors (AF)* for the ice class assigned.

12.6.3 In addition to the ice pressure plan required in *Pt 8, Ch 2, 12.5 General arrangement 12.5.1*, consideration is to be given to the enhancement of longitudinal strength based on the operational profile. The utilisation factor, η , in *Table 2.10.12 Longitudinal strength criteria*, is to be adjusted accordingly.

12.7 Propulsion and machinery arrangements

12.7.1 Icebreakers are to be equipped with means of propulsion that meet the operational envelope criteria. Demonstration of suitable propulsion power for the operational envelope criteria as specified in *Pt 8, Ch 2, 12.3 Information to be submitted 12.3.1*, as appropriate, may be from any of the following or other appropriate methods:

- (a) theoretical formulation, as given in *Pt 8, Ch 2, 12.7 Propulsion and machinery arrangements 12.7.2* and *Pt 8, Ch 2, 12.7 Propulsion and machinery arrangements 12.7.3*;
- (b) technical investigations based on engineering principles;
- (c) service experience at the operating ice conditions; and
- (d) ice model tests.

Consideration should be given to the applicable speed in relation to the ice thickness, as provided in *Pt 8, Ch 2, 12.3 Information to be submitted 12.3.1*, and the operational profile.

12.7.2 The propulsion power, at 2 knots, for icebreakers may be expressed as follows, where the ice thickness and icebreaker breadth form the dominant role:

$$P = 100B^{0.7}h\left(1.4 - \frac{2h}{B}\right) \text{ kW}$$

where

B = breadth of icebreaker, as defined in *Pt 3, Ch 1, 6.1 Principal particulars*, in metres

h = nominal level ice thickness, in metres.

12.7.3 The propulsion power, at 2 knots, for icebreakers may be expressed as follows, where *Pt 8, Ch 2, 12.7 Propulsion and machinery arrangements 12.7.3* is modified to account for the hullform:

$$P = 96 \left(\frac{\theta_{\text{stem}}}{\arctan\left(\frac{h}{B}\right)} + \frac{\alpha_{\text{waterline}}}{\arctan\left(\frac{B}{L}\right)} \right) B^{0.7} h \left(1.4 - \frac{2h}{B}\right) \text{ kW}$$

Where

L = length of icebreaker, as defined in *Pt 3, Ch 1, 6.1 Principal particulars*, in metres

B = breadth of icebreaker, as defined in *Pt 3, Ch 1, 6.1 Principal particulars*, in metres

h = nominal level ice thickness, in metres.

θ_{stem} = stem angle, see *Figure 2.12.1 Icebreaker stem angles*

$\alpha_{\text{waterline}}$ = waterline angle, see Figure 2.12.1 Icebreaker stem angles

Figure 2.12.1 Icebreaker stem angles

12.7.4 The formulae given in Pt 8, Ch 2, 12.7 Propulsion and machinery arrangements 12.7.2 and Pt 8, Ch 2, 12.7 Propulsion and machinery arrangements 12.7.3 are based on the broad fleet of icebreaker designs ($60 \leq L \leq 140\text{m}$ and $15 \leq B \leq 28$) and level ice thicknesses ($0.5 \leq h \leq 2\text{m}$). Adjustments may therefore be required to account for specific propulsion arrangements, alternative speed criteria, size-mass effects, other L/B ratios and ice conditions.

12.7.5 The propulsion power condition is to be considered, whereby 100 per cent of the rated ahead speed is available for a minimum of 30 minutes. A minimum astern power condition is to be considered, whereby 70 per cent of the rated astern speed is available for a minimum of 30 minutes.

12.7.6 Consideration should be given to machinery protection against over-speeding, excess torque, overloading and overheating.

12.7.7 Propulsion system redundancy is to be considered. Where a machinery redundancy (**PMR**, **SMR** or **PSMR**) notation is to be assigned in addition to an **Icebreaker(+)** notation, the requirements of Pt 5, Ch 22 Propulsion and Steering Machinery Redundancy are to be complied with.

12.7.8 Icebreakers are prone to additional noise and vibration. Conditions when icebreaking are to be considered when applying the rules, see Pt 5, Ch 1, 4.3 Resilient mountings and Pt 7, Ch 13 On-shore Power Supplies.

12.8 Rudder and steering arrangements

12.8.1 Rudder posts, rudder horns, solepieces, rudder stocks and pintles are to be dimensioned in accordance with Pt 8, Ch 2, 10.25 Rudders. The minimum speed for rudder dimensioning purposes is to be taken as the speed required for the assigned Polar Class as a minimum. Increases above the minimum speed may be required based on the operational profile.

12.8.2 Steering arrangements are to be in accordance with Pt 8, Ch 2, 11.24 Steering arrangements. The arrangements are to comply with the assigned Polar Class as a minimum. Increases above the minimum requirements may be required based on the operational profile.

12.9 Towing

12.9.1 For escort icebreakers, arrangements for towing are to be provided, including a notch shape in the stern and provision of two chock pipes and two bitts. Consideration should be given for stern plating and framing to be strengthened to withstand impact loads for escorted ship collisions, as well as the propulsion and steering gear layout and protection from contact with bulbous bows. See Pt 4, Ch 3, 7 Towing arrangements.

12.10 Winterisation

12.10.1 Where a winterisation notation is assigned in compliance with the Rules for the Winterisation of Ships, July 2021, the following features are to be additionally considered:

- (a) bridge wings are to be fully enclosed;
- (b) ice removal measures, through heating arrangements, are to be provided to access routes to towing equipment for escort icebreakers;
- (c) provisions for evacuation onto ice;
- (d) additional search lights for mooring, astern manoeuvring and towing operations;

- (e) consideration of a red (flashing) navigation light to be used to indicate when an escort icebreaker is stopped;
- (f) provisions to prevent water freezing in water and fluid systems, including research laboratories and services;
- (g) consideration of ice accretion in damage condition; and
- (h) protection from ice accretion by enclosed aft walkways for icebreakers with an exposed aft deck.
